## 25 **Introduction**

26 As chapters 2 and 9 discuss, teaching for equity and engagement is as rewarding as it  
27 is complex. Teachers who use the big ideas approach and teach mathematics by way of  
28 carefully designed, intriguing investigations see their students come alive through  
29 exploration and discovery; students see what math can do and are motivated to go  
30 deeper as they experience their own math capability. However, since most teachers did  
31 not learn math this way, they need support to rethink math teaching and acquire skills  
32 and strategies that result in the changes in practice vital to improving student learning.  
33 This chapter is about how to ensure such teacher support by planning and designing a  
34 broad system of structured, ongoing, professional learning programs.

## 35 **A System of Professional Learning and Support for** 36 **Mathematics Teachers**

37 As students learn and process mathematics, their teachers learn the effects of their  
38 teaching practices and make refinements. These complementary processes form the  
39 core learning environment for mathematics. As detailed in earlier chapters, student  
40 success depends on enabling teachers to create a learning environment that is  
41 equitable and engaging. That requires providing teachers with a broad system of  
42 ongoing professional learning and support. Administrators and teacher leaders, such as  
43 coaches and teachers on special assignment, provide the initial, programmatic layers of  
44 support, while parents, counselors, and community members co-create an  
45 interconnected system that supports children and adolescents as they learn.

46 How can leaders design systems that effectively provide needed professional learning  
47 and teacher support?<sup>1</sup> First, designers need clarity on what is meant by professional  
48 learning. In this framework, professional learning refers to planned and organized  
49 processes that actively engage educators in cycles of continuous improvement guided  
50 by the use of data and active inquiry around authentic problems and instructional  
51 practices (Coggshall, 2012; Darling-Hammond, Hyler, and Gardner, 2017). Within that  
52 definition, those planning mathematics professional learning—including administrators  
53 and teacher leaders at the local, state, and county levels—need to be grounded in key  
54 priorities that underlie an effective system’s design. That is, they need to understand  
55 and embrace the vision for mathematics teaching and learning, the major strands of  
56 mathematics practices and content as teaching progresses through the grades, and the  
57 primacy of equity.

---

<sup>1</sup> To provide consistency across subjects for those creating professional learning opportunities, this chapter mirrors chapter 12 (Implementing High-Quality Science Instruction: Professional Learning, Leadership, and Supports) of the *California Science Framework* (CDE, 2016) and echoes many of its recommendations for supporting quality instruction.

58 ***The vision for mathematics teaching and learning.*** This framework embodies the  
59 vision that guides creation of effective professional learning programs for mathematics  
60 teaching. As described in chapter 2, the goal of mathematics teaching and learning is  
61 “for students to view mathematics as a vibrant, inter-connected, beautiful, relevant, and  
62 creative set of ideas.” Chapter 2 details five components of equitable and engaging  
63 teaching for all students that nurture this view of mathematics:

- 64 1. Plan teaching around big ideas
- 65 2. Use open, engaging tasks
- 66 3. Teach toward justice
- 67 4. Invite student questions and conjectures
- 68 5. Center reasoning and justification

69 In addition, Darling (2019) provides a framework that is important for supporting  
70 linguistically and culturally diverse English learners as well as other students:

- 71 1. Take an asset approach and recognize multilingualism as a power
- 72 2. Include group work (strategically grouping for language development)
- 73 3. Make work visual (include graphic organizers and visual examples and  
74 encourage visual communication)
- 75 4. Build on students' lived experiences and cultures (allow native language use)
- 76 5. Scaffold learning and language development (including sentence frames and  
77 sentence starters)
- 78 6. Give opportunities for pre-learning (giving students opportunities to learn some  
79 prerequisite material ahead of time)

80 Professional learning experiences for teachers, teacher leaders, and administrators  
81 must be designed to support instruction that implements these themes.

82 ***The major strands of mathematics practices and content that progress through***  
83 ***the grades.*** Chapters 3 through 5 of this framework illustrate how instruction  
84 progresses across the transitional kindergarten through grade twelve continuum through  
85 the development of major mathematical strands—that is, mathematical practices and

86 content. Chapters 6 through 8, the grade-band chapters, further detail ways educators  
87 can maintain a focus on big ideas and implement instruction in developmentally  
88 appropriate ways.

89 Big ideas are central to the learning of mathematics, link numerous mathematics  
90 understandings into a coherent whole, and provide focal points for student  
91 investigations (Charles, 2005)—i.e., authentic activities or projects that are the  
92 backbone of teaching the big ideas. An authentic activity or problem is one in which  
93 students investigate or struggle with situations or questions about which they actually  
94 wonder. Lesson design should be built to elicit that wondering. In contrast, an activity is  
95 inauthentic if students recognize it as straightforward practice of recently learned  
96 techniques or procedures, including the repackaging of standard exercises in forced  
97 “real-world” contexts. Mathematical patterns and puzzles can be more authentic than  
98 such “real-world” settings.

99 Throughout the grades, classroom investigations or activities, designed around big  
100 ideas, are framed by a conception of the why, how, and what of mathematics—a  
101 conception that makes connections across different aspects of content and also  
102 connects content with mathematical practices. Three Drivers of Investigation (DIs)—  
103 sense-making, predicting, and having an impact—provide the “why” of an activity. Eight  
104 Standards for Mathematical Practice (SMPs) provide the “how.” And four types of  
105 Content Connections (CCs)—which ensure coherence throughout the grades—provide  
106 the “what.” Figure 10.1 maps out the interplay at work when this conception is used to  
107 structure and guide student investigations. Because instruction is tied to these three  
108 dimensions, this instructional design approach should play a major role in the design of  
109 professional learning.

110 Figure 10.1 The *Why*, *How*, and *What* of Learning Mathematics

111

112 Note: The activities in each column can be combined with any of the activities in the  
 113 other columns.

114 [Long description of figure 10.1](#)

115 ***The primacy of equity.*** Mathematics education has a long history of inequitable  
116 access to rich learning (see chapters 1, 2, and 9 for more discussion of this topic). It is  
117 incumbent on all in education, at state, county, district, site, and departmental levels, to  
118 work together to create, adapt, and implement professional learning experiences  
119 designed to help teachers challenge and overcome the legacy practices that continue to  
120 perpetuate these inequities in access and attainment. Even when professional learning  
121 is designed with a different primary focus (mathematical practices, particular  
122 instructional routines, or teaching big ideas, for instance), its implementation should be  
123 relevant to students’ cultural backgrounds and existing funds of knowledge. It should  
124 also include awareness of and attention to the impacts of unconscious bias on students’  
125 experiences in the mathematics classroom.

126 Professional learning opportunities should highlight equity alongside focus on content  
127 and motivation; each of these plays an important role in promoting improved outcomes  
128 in math classes. Equity cannot be an afterthought to more traditional content-centered  
129 offerings that do nothing to address the fact that “Black, Latinx, Indigenous, women, and  
130 poor students, have experienced long histories of underrepresentation in mathematics  
131 and mathematics-related domains” (Martin, 2019; see also Martin, Anderson, and Shah,  
132 2017). Inequities caused by systemic issues have resulted in a “culture of exclusion”  
133 that persists even in equity-oriented teaching (Louie, 2017). Students’ perceptions of  
134 their capacity to succeed in mathematics are shaped by messaging from teachers and  
135 society. Many efforts in recent years have focused on increasing rates of success  
136 among members of historically underrepresented groups in mathematical fields. These  
137 include expanded professional training in effective pedagogical practices as well as  
138 greater attention on role models and kinds of materials used in the classroom.

139 It is important for educators to be provided with explicit connections, references, and  
140 links to descriptions and supports for the implementation of English learner–centered  
141 strategies such as *sentence frames*, *leveled prompts*, *vocabulary banks*, *cognate study*,  
142 *intentional groupings*, and *the use of primary language as support*, among others.  
143 These provide purposeful experiences for English learners to engage with language and  
144 mathematical concept development as they deepen their knowledge of the SMPs. In

145 addition to the resources listed below, several vignettes in this framework, especially in  
146 chapters 2, 6, and 7, include specific guidance to help teachers understand and  
147 implement instruction that supports English learners. Moreover, in the transition to  
148 increased hybrid learning, accommodations and connections to the California English  
149 Language Development Standards (ELD Standards) and online resources should be  
150 explicitly addressed, applied, and incorporated into in-person and virtual asynchronous  
151 and synchronous lessons. Teachers need to continue using online multilingual  
152 resources as well as online platforms to help communicate expectations for both  
153 students and parents.

## 154 **Critical Content for Professional Learning**

155 Due to the inherent complexity of teaching, there is a risk of trying to do everything at  
156 once. But for programs to be effective, it is important to design opportunities around a  
157 manageable subset of critical content areas. Figure 10.2 (adapted from the 2014  
158 *English Language Arts/English Language Development Framework [ELA/ELD*  
159 *Framework]*) outlines major content areas from which designers of professional learning  
160 programs can draw.

161 Figure 10.2 Critical Content for Professional Learning in Mathematics Education

### 162 ***Establishing a Vision for California's Students***

- 163 • Develop the readiness for college, careers, and civic life
- 164 • Attain the capacities of numerate individuals
- 165 • Become broadly literate in quantitative subjects
- 166 • Acquire the skills for living and learning in the twenty-first century

### 167 ***Understanding the Standards***

- 168 • California Common Core State Standards for Mathematics (CA CCSSM)
- 169 Mathematical Practice Standards
- 170 • CA CCSSM Content Standards
- 171 • ELA and ELD Standards as implemented in mathematics classes
- 172 • Implementing science, history/social studies, career and technical education, and

173 other standards in tandem with mathematics

174 ***Establishing the Context for Learning***

- 175 • Integrating the curricula
- 176 • Motivating and engaging learners
- 177 • Teaching from big ideas, not individual standards
- 178 • Respecting learners and the cultural and linguistic assets they bring
- 179 • Ensuring intellectual challenge

180 ***Enacting the Key Themes of Mathematics Instruction***

- 181 • Mathematics as tools for solving authentic problems in authentic contexts
- 182 • Meaning making
- 183 • Mathematical practices
- 184 • Language development
- 185 • Effective expression
- 186 • Content knowledge

187 ***Addressing the Needs of Diverse Learners***

- 188 • Comprehensive English language development: integrated and designated ELD
- 189 • Additive approaches to language and mathematics development
- 190 • Meeting the needs of students with disabilities and students experiencing
- 191 difficulty
- 192 • Meeting the needs of advanced learners and other populations

193 ***Exploring Approaches to Teaching and Learning***

- 194 • Teaching through investigation
- 195 • Models of instruction
- 196 • Culturally and linguistically responsive teaching
- 197 • Supporting biliteracy and multilingualism
- 198 • Supporting students strategically (including Universal Design for Learning [UDL]
- 199 and the Multi-Tiered System of Support [MTSS])

200 ***Sharing the Responsibility***

- 201 • Collaborating within and across grades, departments, and disciplines
- 202 • Promoting teacher leadership
- 203 • Partnering with community groups and higher education
- 204 • Collaborating with parents

205 ***Evaluating Teaching and Learning***

- 206 • Types and methods of assessment (formative, summative, rubrics, portfolios,  
207 diagnostic)
- 208 • Cycles of assessment (short, medium, long)
- 209 • Student involvement in assessment
- 210 • Appropriate preparation for state assessments

211 ***Integrating Twenty-First Century Learning***

- 212 • Critical thinking skills
- 213 • Creativity and innovation skills
- 214 • Communication and collaboration skills
- 215 • Community awareness leading to global awareness and competence
- 216 • Technology skills

217 Source: Adapted from the 2014 *ELA/ELD Framework*

218 **Professional Learning Throughout a Teacher’s Career**

219 As noted above, in this framework professional learning refers to planned and organized  
220 processes that actively engage educators in cycles of continuous improvement guided  
221 by the use of data and active inquiry around authentic problems and instructional  
222 practices (Coggshall 2012; Darling-Hammond, Hylar, and Gardner, 2017). Teachers’  
223 learning occurs in many contexts, including by way of working with students in the  
224 classroom, interacting with peers, communicating with administrators, attending  
225 conferences, enrolling in online courses, and reading publications. This section  
226 describes

- 227 • important aspects of professional learning at different stages of an educator’s  
228 career, with particular focus on characteristics of effective professional learning;

- 229 • considerations for planning effective professional learning at each career stage;
- 230 and
- 231 • discussion of various models and strategies for professional learning, with
- 232 several vignettes illustrating the models and how they incorporate characteristics
- 233 of effective professional learning.

234 Understanding key shifts in thinking about professional learning will help designers  
 235 develop programs that effectively improve teaching practice. Figure 10.3, adapted from  
 236 the National Comprehensive Center for Teacher Quality’s publication *Toward the*  
 237 *Effective Teaching of New College- and Career-Ready Standards: Making Professional*  
 238 *Learning Systemic* (Coggshall, 2012), summarizes those shifts.

239 Figure 10.3 Key Shifts in Thinking About Professional Learning

Moving From	Moving Toward
Believing that professional development is some people’s responsibility	Believing that professional learning focused on student learning outcomes is everyone’s job
Thinking individual goals for professional development are separate from school site and district goals	Aligning individual goals with school site and district goals to provide greater coherence
Using professional development as a means of addressing deficiencies	Embedding professional learning in continuous improvement
Seldom addressing standards for professional learning	Using standards for professional learning
Providing professional development that takes place outside of school, away from students, and is loosely connected to classroom practice	Embedding professional learning in the daily work of teaching so that staff can learn collaboratively and can support one another as they address real problems and instructional practices of their classrooms
Engaging staff in professional development unrelated to data and the continuous improvement process	Engaging staff in a cycle of continuous improvement, guided by the use of active inquiry and multiple sources of evidence

Moving From	Moving Toward
Providing one-shot or short-term professional development with little or no transfer to the classroom	Sustaining continuous professional learning through follow-up, feedback, and reflection to support implementation in the classroom
Limiting professional development based on scarce resources and discrete funding sources	Dedicating and reallocating resources to support professional learning as an essential investment

240 Source: Coggshall, 2012.

241 Professional learning occurs across all key stages of a teacher’s career—preparation,  
242 induction, and in-service—as follows.

### 243 **Teacher Preparation**

244 Since CA CCSSM-aligned instruction is different in significant ways from the school  
245 mathematics experience of most teachers, the phases of new teacher preparation and  
246 induction are key factors in providing a pipeline of teachers with the skills and  
247 knowledge to provide high-quality CA CCSSM-aligned instruction. Educators of pre-  
248 service teachers need to align their programs to reflect the authentic-context, big-idea-  
249 based instruction described in this framework so that pre-service teachers have the  
250 opportunity to experience it as learners. Factors to consider in the development of CA  
251 CCSSM-aligned teacher preparation programs include the following:

- 252 ● Early field experience hours that are dedicated to observing and interacting with  
253 students and teachers in authentic mathematics classroom environments.
- 254 ● Student teaching opportunities that include content-rich experiences and  
255 integrated learning experiences.
- 256 ● Mathematics and mathematics methods classes that address mathematics as a  
257 collection of tools and lenses for making sense of authentic contexts, with  
258 emphasis on learning mathematical ideas through the mathematical practices  
259 and active-learning pedagogy rather than passive lecture.

- 260 ● Mathematics and mathematics methods classes that develop mathematics  
261 through asset-based, culturally and linguistically relevant and sustaining  
262 pedagogy.
- 263 ● Mathematics methods classes that address pedagogical content knowledge that  
264 facilitates student conceptual understanding of content standards over time and  
265 how to address incorrect, developing, and alternative student conceptions of  
266 those ideas.
- 267 ● Student teaching experiences with mathematics teachers who are effectively  
268 incorporating CA CCSSM.
- 269 ● Effective examples of the development of mathematical ideas through the  
270 investigation of authentic contexts and problems (in both pre-service teacher  
271 course work and student teaching).
- 272 ● Mathematics methods classes that address how to organize instruction around  
273 big ideas and meaningful investigations, rather than isolated standards.
- 274 ● Mathematics and mathematics methods classes that explore mathematics, and  
275 the teaching and learning of mathematics, from many cultures. By taking the time  
276 to acknowledge and center contributions to mathematical understanding from  
277 Africa, South America, Asia, and indigenous peoples around the world, educators  
278 can ensure that students can better appreciate the global nature of mathematical  
279 discovery. In a similar way, prospective teachers in methods courses can expand  
280 their understanding of teaching and learning mathematics by exploring a variety  
281 of approaches from a diverse array of cultures. Mathematics methods classes  
282 can make evident ways in which language and content are interconnected and  
283 mutually reinforcing; one cannot develop without the other. Language needed for  
284 disciplinary thinking and concepts should not be taught in isolation but in the  
285 context of what students relate to and need to know to access and communicate  
286 mathematical thinking. Opportunities to practice language and communicate  
287 understanding must be integrated (e.g., students have the opportunity to gain  
288 ideas from a discussion or a reading before writing).

289 Additionally, mathematics education faculty and other educators (e.g., university field  
290 advisors, master cooperating teachers) who provide pre-service instruction must be

291 grounded in the CA CCSSM-relevant knowledge and skills to facilitate their students’  
292 (pre-service teachers) ability to address the CA CCSSM’s vision. Important resources  
293 for guiding the design of high-quality teacher preparation programs and, specifically,  
294 mathematics teacher preparation programs include the Learning Policy Institute’s  
295 *Effective Teacher Professional Development* (Darling-Hammond, Hylar, and Gardner,  
296 2017); *Preparing Teachers—Building Evidence for Sound Policy* (NRC, 2010); *Powerful*  
297 *Teacher Education, Lessons from Exemplary Programs* (Darling-Hammond, 2006); the  
298 National Council of Teachers of Mathematics’ Professional Development Guides  
299 (NCTM, n.d.); and *Mathematical Education of Teachers II, Conference Board of the*  
300 *Mathematical Sciences* (Conference Board of the Mathematical Sciences [CBMS],  
301 2012).

## 302 **Induction for New Teachers**

303 Teaching is hard and thoughtful work. It is not uncommon for new teachers to feel  
304 isolated and burdened by the demands (both managerial and instructional) of preparing  
305 for and working in a classroom. The implementation of effective preparation and support  
306 programs specifically tailored to the needs of new teachers can alleviate these issues to  
307 a large degree. Induction program designers should consider doing the following to  
308 provide support for prospective teachers of mathematics:

- 309 ● Redefine the professional dynamics of the teacher induction process by pairing  
310 beginning mathematics teachers with experienced mathematics teachers who  
311 can act as mentors rather than delegators. This connection may help address the  
312 need for inclusion and community and may provide new teachers with a sense of  
313 ownership of the content and a sense of belonging in the mathematics  
314 department, leading to greater teacher retention.
- 315 ● Recognize and support the need for elementary teachers to receive math-  
316 specific support and mentoring (see the “Content Focused” section below).
- 317 ● Ensure that beginning mathematics teachers have comparable access to  
318 mathematics teaching resources (including technology, teaching spaces, and  
319 materials for hands-on instruction) as other mathematics teachers in the school.

- 320 ● Involve new teachers in available professional learning communities, lesson  
321 study, or the like, particularly math-specific ones, to promote and aid regular  
322 reflection on their practice (Fulton and Britton, 2010).
- 323 ● Encourage new teachers to attend mathematics teacher conferences, institutes,  
324 and workshops (and financially support them to do so).
- 325 ● Ensure that beginning teachers understand who their students and families are,  
326 in particular their emerging multicultural learners, their interests, aspirations, and  
327 cultural and environmental backgrounds, and how to use those as resources for  
328 learning.

## 329 **Ongoing Professional Learning for In-Service Teachers**

330 A key component of professional learning, effective professional development, is vital to  
331 improving student learning outcomes. Effective professional development is structured  
332 professional learning that results in changes in teacher practices. Although there are  
333 many approaches to professional development—along with multiple aspects to each  
334 approach—some strategies and components have been shown to be more effective  
335 than others.

### 336 ***Characteristics of Effective Professional Development***

337 In *Principles to Actions* (2014), NCTM connects education research to teaching practice  
338 with professional learning materials to help educators learn specific, research-based  
339 teaching practices. Moreover, the Learning Policy Institute’s (LPI’s) review of 35  
340 rigorous studies on the implementation of professional development for teachers noted  
341 several elements of effective professional development that ultimately improve student  
342 outcomes (Darling-Hammond, Hyler, and Gardner, 2017). The LPI review found that  
343 generally, effective professional development is content focused, based in active  
344 learning, includes collaboration, uses instructional examples, provides coaching and  
345 expert support, includes feedback and reflection, and has a sustained duration. These  
346 characteristics are further described as follows.

## 347 **Content Focused**

348 Professional development in any discipline has been found to be most effective when  
349 the content knowledge in that area—in this case, mathematics—is a primary focus.  
350 Teachers must have opportunities to explore mathematical big ideas through rich,  
351 authentic, culturally relevant tasks to both deepen their own understanding of  
352 mathematics and better anticipate the challenges students might encounter and the  
353 strategies they may rely on to respond to them. These big ideas include the  
354 mathematical practices as central aspects of mathematics, equal in import to content  
355 standards. Professional development that introduces perspectives or teaching  
356 approaches without intentional connections to mathematics is unlikely to bring about  
357 much change in teachers' practice. Professional development that blends pedagogical  
358 and learning knowledge with mathematics knowledge has much more potential to result  
359 in powerful changes in students' learning experiences than that which focuses on  
360 pedagogy or content knowledge separately.

361 Many teachers have experienced mathematics as a set of procedures to be memorized.  
362 This narrow understanding makes access to opportunities to experience mathematics  
363 differently themselves all the more important, lest their own students have their  
364 mathematics identities shaped by similarly limited experiences of mathematics. As  
365 described in chapter 1, the goal is that students achieve conceptual understanding,  
366 problem-solving capacity and procedural fluency (in the full sense of the word fluency  
367 introduced in chapter 1) in mathematics. When teachers work on rich, authentic,  
368 culturally relevant mathematics tasks—through which they can ask their own questions,  
369 reason and communicate with others, and develop curiosity and wonder—they start to  
370 see mathematical connections they may never have seen before. This often changes  
371 teachers' relationships with mathematics, which is an important precursor to changing  
372 their teaching (see also Anderson, Boaler, and Dieckmann, 2018). This experience  
373 takes time and needs to be carefully organized, with teachers working together on  
374 mathematics in a supportive environment with an expert facilitator. Face-to-face  
375 professional development is the ideal way to encourage this experience, but online

376 courses can also provide this experience, especially when teachers receive funded time  
377 to take the courses in groups.

### 378 **Based in Active Learning**

379 Teachers benefit most from professional development that engages them in the process  
380 of actively designing and trying teaching strategies and that provides them with  
381 opportunities to engage in the same style of learning they are designing for their  
382 students. Such professional practice relies on authentic artifacts, interactive activities,  
383 and other strategies to provide deeply embedded, highly contextualized professional  
384 learning. This approach moves away from traditional learning models and environments  
385 that are lecture based and fail to connect to teachers' classrooms and students. Instead,  
386 teachers should have opportunities to make sense of student thinking (in order to  
387 assess students' funds of knowledge and other assets—such as reasoning and  
388 communication practices—that will help drive teacher actions), reflect on their own and  
389 one another's instructional practices, and discuss connections to their own classroom.  
390 Classroom video is a powerful resource for such reflections and discussions. For  
391 example, professional development may include opportunities to watch videos showing  
392 linguistically and culturally diverse communities of English learners working to high  
393 levels with an expert teacher. Videos and other records of practice such as student work  
394 should be at the center of professional development opportunities.

### 395 **Includes Collaboration**

396 Effective professional development requires time and resources for teachers to share  
397 ideas and collaborate in their learning, often at the school level. Working collaboratively  
398 allows teachers to create professional learning communities that can positively change  
399 the culture and instruction at a classroom, grade, department, school, or district level.  
400 As teachers work together on mathematics instruction, they experience the  
401 collaborative, connected mathematics experience as a template for their own  
402 classrooms. They can also share experiences, including challenges, successes, and  
403 insights, to support one another in planning and implementing lessons. Professional  
404 learning communities are also important places where teachers can consider ways in

405 which mathematics instruction can recognize students' cultural and linguistic assets and  
406 ways to draw on those assets to make contexts and problems ever-more authentic.

#### 407 **Uses Instructional Examples**

408 Seeing lessons, tasks, and curriculum in action is a powerful tool for providing teachers  
409 with opportunities to experience best practices firsthand. Teachers may view examples  
410 that include lesson plans, unit plans, sample student work, observations of peer  
411 teachers, and video or written cases of teaching, such as the many vignettes presented  
412 in this framework. Teachers benefit from opportunities to discuss examples of teaching,  
413 reflect on current practices, and make connections to their own classrooms.

414 Effective professional learning must build teachers' capacities to notice, analyze, and  
415 respond to students' thinking (NCTM, 2014, 101). Professional learning built around  
416 artifacts of practice such as student work (written, video, or other) provides time and  
417 support to develop these capacities.

#### 418 **Provides Coaching and Expert Support**

419 Implementing new teaching approaches can create challenging transitions in particular  
420 classrooms, schools, or even districts. Fortunately, coaching and expert support—  
421 especially from district and county mathematics coaches—have proven extremely  
422 effective in responding to these challenges when such support is structured around a  
423 particular purpose (e.g., for adopting new curricula or implementing specific new  
424 instructional practices) and is aligned with school-wide goals and priorities. Well-trained  
425 peers and teacher leaders with expertise in particular approaches can be powerful  
426 facilitators of growth by encouraging, modeling, and sharing insights—particularly when  
427 supported by the administration and by appropriate structures. These leaders can  
428 spend time observing teachers' instructional practices, recognize assets that teachers  
429 can build on, and work with teachers to develop the capacity to implement rich, student-  
430 centered mathematics lessons.

431 **Includes Feedback and Reflection**

432 High-quality professional development ensures that teachers are afforded dedicated  
433 time to think about, receive input on, and make changes to their practice. Reflection and  
434 feedback enable teachers to establish and refine realistic goals for changing their  
435 practice as they move toward expert visions of practice.

436 Formative assessment that provides evidence of student learning on rich assessment  
437 tasks provides one source of feedback that can be generative when combined with  
438 opportunities for collaborative teacher learning. For example, Boaler and Foster (2021)  
439 describe achievement gains that resulted when teachers in a group of districts  
440 participated in collaborative professional development focused on helping them teach  
441 broader and deeper mathematics to a wide range of students. The professional  
442 development engaged teachers in a formative assessment cycle (Briars et al., 2013;  
443 Foster and Poppers, 2011) centered around rich mathematical tasks designed by the  
444 Mathematics Assessment Resource Service (MARS). This process helped them to  
445 analyze and reflect on their students' learning while gaining knowledge of mathematics  
446 content and pedagogy, which enabled them to craft and teach new lessons that  
447 successfully engaged their students in key mathematical concepts.

448 **Has a Sustained Duration**

449 Effective professional development provides teachers with adequate time to learn,  
450 practice, implement, and reflect on new strategies that facilitate growth in their practice.  
451 Professional development that engages teachers in making incremental changes over  
452 time (and reinforces existing effective practices) can bring about lasting positive change.

453 **Planning for Effective Professional Learning**

454 Achieving this framework's vision of mathematics education will require improved  
455 systems of professional learning. Teachers, specialists, paraprofessionals, and school  
456 and district leaders should articulate personal and collaborative learning goals across  
457 grade levels and departments, focusing on curriculum, instruction, and assessment  
458 strategies that embrace the vision of the CA CCSSM and this framework. Schools,

459 districts, and other local education agencies (LEAs) must become “learning  
460 organizations” (Senge, 1990) engaged in continuous improvement around the teaching  
461 and learning of mathematics. At every level (grade, department, school, and district)  
462 educators must share a vision that focuses on student learning, collaboration, collective  
463 inquiry, shared practices, reflection, and results (DuFour, 2004; Hord and Sommers,  
464 2008; Louis, Kruse, and Marks, 1996). As discussed in the “Role of Parents, Guardians,  
465 and Families” section later in this chapter, families are collaborators in this shared  
466 vision. Families’ involvement provides educators and administrators with a better, more  
467 holistic understanding of students’ learning needs.

468 County offices of education, districts, schools, and other LEAs providing professional  
469 learning can use the report “Effective Teacher Professional Development” (Darling-  
470 Hammond, Hyler, and Gardner, 2017) as a resource for planning these types of learning  
471 experiences. This report provides much more detail about the features of effective  
472 professional learning described above.

473 Another resource for those designing professional learning opportunities is the  
474 *Professional Development Design Framework* (Loucks-Horsley et al., 2010). Through  
475 their research with national professional developers, Loucks-Horsley and her colleagues  
476 found that effective programs had several common characteristics: They were designed  
477 to meet various factors, to change over time, and to adapt to particular goals and  
478 contexts. They did not rely on formulas; instead, the designers used a process of  
479 thoughtful, conscious decision making. The authors used these factors and processes  
480 to create the framework shown in figure 10.4.

481 Figure 10.4 Professional Development Design Framework

482

483 Source: Loucks-Horsley et al., 2010.

484 At the center of the design framework, illustrated in the six squares connected with  
 485 horizontal arrows, is a planning sequence that includes the following topics: (1)  
 486 committing to a vision and a set of standards; (2) analyzing student learning and other  
 487 data; (3) setting goals; (4) planning; (5) doing; and (6) evaluating results. The circles  
 488 above and below the planning sequence represent important inputs into the design  
 489 process that can help designers of professional learning make informed decisions.  
 490 These inputs prompt designers to: consider the extensive knowledge bases (knowledge  
 491 and beliefs) that can inform their work; understand the unique features of their context;  
 492 draw on a wide repertoire of professional development strategies; and wrestle with  
 493 critical issues that instructional reformers will encounter.

494 While there is no exact starting place for using the design illustrated in figure 10.4,  
 495 effective planning should avoid starting with strategies—though they may seem most  
 496 appealing. Instead, the use of evidence (derived through questions such as, What are  
 497 the assets? or, What are the needs?) is encouraged. Designers should think about  
 498 short- and long-term approaches (up to five years) as well as teacher career trajectories  
 499 and plan to support teachers accordingly (Task Force on Educator Excellence, 2012).

500 However, those developing professional learning must also remain mindful of the need  
501 to stay flexible and adaptive. They should include openness to refining their ideas as  
502 they evaluate the implementation process. As the design and implementation phases  
503 are taking place, recommendations from *Innovate: A Blueprint for Science, Technology,*  
504 *Engineering, and Mathematics in California Public Education* (STEM Task Force, 2014)  
505 and the characteristics of effective professional learning should also be considered.

506 Note that although the framework in figure 10.4 is arranged as a linear and sequential  
507 model, it need not be employed as such. What is most important is to pay attention to  
508 the four core design inputs, where they impact the design of the program, and how they  
509 are addressed during implementation.

## 510 **Models and Strategies: Effective Professional Learning**

511 The characteristics of effective professional learning can be implemented through many  
512 professional development models and strategies, including the following:

### 513 ***Professional Development Models***

- 514 ● Professional Learning Communities (PLCs): PLCs provide opportunities for  
515 teachers to collaborate with each other and for administrators to collaborate with  
516 teachers in a team setting.
- 517 ● Communities of Practice: Communities of practice are “...groups of people who  
518 share a concern or a passion for something they do and learn how to do it better  
519 as they interact regularly” (Wenger-Trayner and Wenger-Trayner, 2015). In  
520 educational settings, PLCs are often site-based, whereas communities of  
521 practice often connect educators across sites, helping provide additional contacts  
522 and resources for improving practice.
- 523 ● Classroom Coaching: A mathematics coach is an individual who is well-versed in  
524 mathematics content and pedagogy and who works directly with classroom  
525 teachers to improve student learning of mathematics (Hull, Balka, and Miles,  
526 2009).
- 527 ● Lesson Study: See below.

- 528 ● Mathematics Labs: Mathematics labs provide a collaborative design and  
529 instruction cycle, similar to Lesson Study but with collaborative instructional  
530 decisions even during the lesson’s implementation (Kazemi et al., 2018).
- 531 ● Content-Intensive Institutes with Follow-Up Workshops: See below.

### 532 **Professional Development Strategies**

- 533 ● Backward Design: Backward design focuses on the importance of student  
534 learning outcomes in lesson design.
- 535 ● Universal Design for Learning (UDL): This strategy focuses on the  
536 implementation of and alignment with the guidelines of UDL.
- 537 ● Networking and Community Building: These strategies focus on building a  
538 community around mathematics instruction.
- 539 ● Partnerships: Partnerships with university mathematics and mathematics  
540 education faculty help bridge the research–practice divide.

541 Three models that are supported by research into effective professional development in  
542 mathematics are explored below. The first, lesson study, offers sustained content-  
543 focused courses with school-year follow-up and coaching. In a survey of the  
544 effectiveness of 643 professional development models, only two models were found to  
545 have a significant positive effect on students’ learning—lesson study and sustained  
546 content-focused summer courses with pedagogy-oriented structured academic year  
547 follow-up (Gersten et al., 2014). Coaching models are very common in California  
548 schools, but “...there is little empirical evidence that coaching improves teacher practice”  
549 (Desimone and Pak, 2017). However, some structured coaching models show more  
550 promise for instructional improvement than individual one-on-one models (Gibbons,  
551 2017).

### 552 **Lesson Study**

553 Lesson study is a type of professional learning where teachers engage in an inquiry  
554 cycle that supports their ability to experiment, observe, and improve their teaching by  
555 collaboratively researching, creating, teaching/observing, and revising a lesson. Lesson  
556 study, which originated in Japan, has been shown to be an effective model for

557 professional development with its deliberate focus on planning and teaching practice as  
558 well as inquiry, creativity, and collaboration (Lewis and Hurd, 2011).

559 The proven effectiveness on student learning led the California Mathematics Project  
560 (CMP), one of the nine subject disciplines that comprise the California Subject Matter  
561 Project, to formally adopt lesson study as a preferred means of professional  
562 development in 2018. CMP later spearheaded the creation of the California Action  
563 Network for Mathematics Excellence and Equity (CANMEE, n.d.), which supports  
564 California schools and districts in implementing high-quality lesson study. The Lesson  
565 Study Group at Mills College provides many online resources to support such  
566 implementation.

567 The lesson study cycle consists of four phases (Mills College. n.d.), as shown in figure  
568 10.5.

569 Figure 10.5 The Four Phases of the Lesson Study Cycle

570

571 Source: Mills College. n.d.

572 In the Study phase, a team of teachers collaborates to:

- 573
- Identify long-term goals for students.
  - 574 ● Choose the subject and unit to investigate.
  - 575 ● Study standards, research, and curricula.

576 In the Plan phase, using insights from the Study phase, the team:

- 577 ● Examines the unit and chooses one lesson to plan in depth.
- 578 ● Articulates the lesson goals.
- 579 ● Tries the lesson task and anticipates student thinking.
- 580 ● Identifies data to be collected during the lesson.

581 In the Teach phase, the team puts that lesson into action:

- 582 ● One team member teaches the lesson.
- 583 ● Other team members observe and record student thinking and learning.

584 In the Reflect phase, the team then reflects on their work by:

- 585 ● Meeting after the lesson to discuss data on student thinking and learning.
- 586 ● Having an outside specialist provide further commentary.
- 587 ● Reflecting on what they learned during the cycle as a whole.

588 Some or all of these phases are often repeated by a team, since a team often wishes to  
589 redesign a lesson based on realizations made in the Reflect phase and teach it again to  
590 another class of students.

591 It is important to note that the “product” of a lesson study cycle is more than a refined  
592 lesson plan. Team members deepen their understanding of content and student  
593 thinking, their commitment to collaboration, and their ability and inclination to base  
594 instructional decisions on evidence of their students’ thinking.

595 Lesson study is particularly fruitful when teachers have access to research-based  
596 mathematics resources (Lewis and Perry, 2017; Perry et al., 2009). Lewis and Perry  
597 (2017) found that locally led lesson study teams randomly selected to receive fraction  
598 resource kits produced significantly greater increases in students’ and teachers’  
599 fractions knowledge than teams that did not receive the resources. The resource kits  
600 included research articles, video, student work, and research-based curricula with a  
601 focus on linear representations of fractions such as number lines (LSGAMC, 2022). The  
602 snapshot below illustrates lesson study being used at the second-grade level.

603 ***Second-Grade Snapshot: Lesson Study***

604 Equity focus: Linguistically and culturally diverse English learners' productive language  
605 use in mathematics

606 Source: The California Action Network for Mathematics Excellence and Equity  
607 (CANMEE) Steering Committee, adapted

608 The second-grade teachers at 54th Street Elementary met during their professional  
609 learning community time to discuss the performance of their emerging multicultural  
610 learners in mathematics. Each teacher noticed that their English learners were having  
611 difficulty explaining their solutions to mathematics problems orally and in writing. They  
612 invited the English language development (ELD) specialist to the meeting to hear their  
613 concerns and obtain suggestions for addressing the students' needs.

614 The ELD specialist had recently observed a lesson at another elementary school  
615 focused on equity. The ELD specialist suggested that the second-grade teachers  
616 consider participating in a lesson study focused on building the agency of their  
617 multilingual students. The teachers decided to engage in a lesson study cycle of 30  
618 hours and followed the lesson study model of Study, Plan, Do/Test (Teach), and  
619 Reflect.

620 As part of the equity focus of the CANMEE lesson study process, each teacher selected  
621 four designated English learners as focal students from their classes and interviewed  
622 them to determine their strengths and challenges in mathematics. Based on the content  
623 of interviews and classroom observations, the teachers drafted assets-based  
624 descriptions for each, then met and shared their focal student descriptions.

625 During the Study phase of their lesson study, the teachers read literature that centered  
626 on effective practices for English learners, such as the *English Language Arts/English*  
627 *Language Development Framework* (CDE, 2014), the *English Learner Roadmap* (CDE,  
628 2017), and important research (Moschkovich, 2012; Ramirez and Celedón-Pattichis  
629 2012). As part of the Plan phase, teachers designed a mathematics lesson with a task  
630 that required students to record their thinking in a journal and share their ideas with a

631 partner. One of the goals for the focal students was to increase their productive  
632 language skills. The teachers engaged in the mathematics task themselves to anticipate  
633 both productive and unproductive student strategies. The teachers developed questions  
634 to ask those students who used unproductive strategies and consulted with the ELD  
635 specialist for additional resources. The specialist posed questions to allow the teachers  
636 to do the thinking.

637 In the Do/Test (Teach) phase, one of the teachers on the team volunteered to teach the  
638 lesson while the other teachers observed the focal students during the lesson to  
639 determine the effect of the lesson they designed. An outside expert in mathematics  
640 content was invited to provide feedback on the mathematics content of the lesson,  
641 serving as the mathematics commentator. The ELD specialist served as the equity  
642 commentator. The ELD specialist observed the focal students' interaction with the  
643 lesson and peers as well as their productive language skills—in particular, aspects of  
644 the lesson design that seemed to facilitate productive language opportunities. The  
645 second-grade teachers also invited other educational partners, including colleagues at  
646 the school and parents, to observe the public lesson.

647 After the lesson was taught, as part of the Reflect phase, the team of teachers shared  
648 their thoughts and observations about the impact of the collaboratively planned lesson  
649 on the participation and learning of the focal students. They also identified ways to  
650 improve their teaching practice moving forward. The mathematics and equity  
651 commentators shared their observations of the lesson and provided suggestions for  
652 next steps. Other observers (including parents) also made comments about the lesson.

653 At the end of the cycle, the second-grade teachers reflected on the professional  
654 learning experience. They noted the value in the ability to collaborate with their peers  
655 about a problem of practice that was specific to their school. The teachers also felt that  
656 the support from the ELD specialist was critical to their success. They all noticed an  
657 increase in agency among the focal students as a result of the lesson study process.  
658 Lastly, the second-grade teachers noted feeling more confident about their ability to  
659 meet the needs of their students who are emerging multicultural learners.

660 (end snapshot)

### 661 ***Content-Focused Workshops with Follow-Up***

662 “One and done” professional development sessions have shown little impact on  
663 teaching practice or student learning (Darling-Hammond, Hyler, and Gardner, 2017). In  
664 addition to lesson study, sustained content-focused professional courses/workshops  
665 with school-year pedagogy-focused follow-up have demonstrated positive impact on  
666 student learning (Gersten et al., 2014). Several partner organizations in California work  
667 with districts and schools to provide these opportunities.

### 668 ***Structured Coaching***

669 The central goal of mathematics coaching is to support mathematics teacher learning  
670 and do so embedded in the contexts in which mathematics teachers do their work.  
671 Coaches can engage individual teachers and groups of teachers in a variety of  
672 potentially productive activities (Gibbons and Cobb, 2017), such as co-planning,  
673 examining student work, modeling instruction, and side-by-side coaching. In each, the  
674 teacher and coach co-participate in some way in the work of teaching—e.g., preparing,  
675 enacting, or reflecting—and work together to make sense of mathematics content,  
676 student thinking, and pedagogy. For coaching to support teacher learning, teachers and  
677 coaches must make visible what they are noticing (Sherin et al., 2011), how they  
678 interpret what they see, and how and why they are making pedagogical decisions  
679 (Horn, 2005; Loughran, 2019).

680 Instructional coaching best contributes to school-wide mathematics instructional  
681 improvement when it is used as a tool to support the collective learning of teachers  
682 (Gibbons, 2017). In other words, the characteristic of effective professional learning that  
683 “provides coaching and expert support” does not stand alone; designating a “good  
684 mathematics teacher” as a coach has not proven to improve teaching practice by itself.  
685 Coaching is effective when it is structured to provide more than a model/co-teach/you  
686 teach feedback loop: “Coaches need to engage teachers in fundamental dialogue about  
687 mathematical content, mathematical learning, and student understanding” (Campbell  
688 and Griffin, 2017). Thus, coaching is effective when it is part of a broader professional

689 learning plan that incorporates most or all of the other characteristics of effective  
690 professional learning, as described in the coaching vignettes [Making Sense of Content,](#)  
691 [Student Thinking, and Pedagogy](#). In each of these vignettes, the teachers' goals for  
692 professional learning shaped both *what* the teacher and coach worked to make sense  
693 of—content, student thinking, or pedagogy—and *how* they worked together. Effective  
694 coaching aligns the teachers' goals with coaching activities that allow the teacher to  
695 actively make sense with a knowledgeable colleague.

## 696 **Building Teacher Leadership**

697 Ultimately, successful development and implementation of effective professional  
698 learning for teachers relies on expertise, which requires district capacity. Using in-house  
699 personnel who may lack the necessary expertise is not effective for creating lasting,  
700 meaningful changes that students are entitled to receive. Yet the use of outside  
701 expertise can, over time, diminish the district's capacity to build internal leadership.  
702 Districts must consider ways to build teacher, curricular, and administrative leadership,  
703 with the assistance of outside sources, to strengthen their long-term capacity to improve  
704 mathematics learning. Every district will have some teachers who actively seek  
705 opportunities to develop personal capacity to provide authentic mathematics learning  
706 opportunities. Identifying these early adopters and supporting their learning—as well as  
707 developing their leadership in supporting other teachers—can be an effective way to  
708 strengthen a school or district's professional learning networks for mathematics.

709 This section begins with the development of teacher leadership as a core strategy for  
710 supporting improvement in teaching and learning. Research indicates that turning  
711 professional learning experiences into changes in teaching and learning practices  
712 requires leadership and support (Lieberman and Miller, 2008; Weiss and Pasley, 2009).  
713 Teacher leadership is associated with increased teacher learning and the creation of  
714 collaborative professional cultures (York-Barr and Duke, 2004; Werner and Campbell,  
715 2017). It is also positively related to increased student achievement (Waters, Marzano,  
716 and McNulty, 2003).

717 As Julian Weissglass (1998) states, “Teacher leadership is about taking responsibility  
 718 for what matters to you.” Everyone has the capacity for leadership, and one goal of  
 719 mathematics teacher leadership is to have many, rather than a few, people leading  
 720 creatively every day and in all aspects of their lives (Kaser et al., 2013). In other words,  
 721 teachers in multiple roles are leaders, ranging from those seeking to be or designated  
 722 as teacher leaders to department chairs, teachers on special assignment, mentors and  
 723 coaches. This view of teacher leadership differs from the traditional view in that  
 724 leadership is not about power and authority. Instead, it embraces five practices of  
 725 exemplary leaders (Kouzes and Posner, 2003), as listed in Figure 10.6.

726 Figure 10.6 Practices of Exemplary Leadership

Practices of Exemplary Leaders	Descriptor
Challenging the process	Searching for opportunities to change the status quo and innovative ways to improve
Inspiring a shared vision	Seeing the future and helping others create an ideal image of what the organization can become
Enabling others to act	Fostering collaboration and actively involving others
Modeling the way	Creating standards of excellence and leading by example
Encouraging the heart	Recognizing the many contributions that individuals make, sharing in the reward of their efforts, and celebrating accomplishments

727 Source: Kouzes and Posner, 2003

728 Leadership development requires explicit attention, clear expectations, and resources,  
 729 time, and expertise (Hopkins et al., 2013; Yow and Lotter, 2016). Mathematics teacher  
 730 leaders need to continually build their (1) in-depth understanding of the mathematics  
 731 content and practices of the CA CCSSM; (2) thorough knowledge of the best practices  
 732 in teaching and learning based in authentic contexts and problems; (3) understanding of  
 733 school culture, organization, and politics; (4) understanding of change theory; (5)  
 734 knowledge of how adults learn; and (6) practices that embrace continuous

735 improvement. Additionally, leaders need skills that include facilitation and  
736 communication, data use, decision making, and organization.

737 Teacher leaders can take on a variety of roles to help colleagues and other educators,  
738 as well as parents, guardians, and community members, become more aware of and  
739 aligned with improvements in mathematics teaching and learning. These roles include  
740 leading in the areas of (1) instruction and assessment; (2) curriculum and instructional  
741 materials; (3) school culture that is supportive and proactive for the implementation of  
742 the CA CCSSM; (4) community support and advocacy for active, authentic mathematics  
743 instruction; and (5) mathematics classroom implementation of the California ELA and  
744 ELD Standards. An explicit current in all of these roles must be access and equity for all  
745 students.

746 To develop needed knowledge and skill sets, teacher leaders need professional  
747 learning targeted toward leadership. Learning experiences are most productive when  
748 they occur over time, provide feedback, are anchored in the practice of instructional  
749 leadership, and ground the leaders in mathematics practices and content (Darling-  
750 Hammond, Hyler, and Gardner, 2017; Fullan, 2015; Kaser et al., 2013). Districts need to  
751 develop leadership programs that embrace these attributes and/or encourage teacher  
752 leaders to participate in leadership experiences through programs such as the California  
753 Mathematics Project.

754 Teacher leadership can manifest in many forms, including presenting (at the school site,  
755 district, or professional organization level), consulting (as informal specialists for other  
756 mathematics teachers), facilitating (through site-level department collaboration, lesson  
757 study groups, or district-level efforts such as assessment and vertical alignment  
758 choices), and coaching.

759 The extensive literature on teacher leadership cited in this section provides additional  
760 sources for further learning by those seeking to empower and support teacher leaders.

## 761 **Governance and Administrative Leadership for Professional** 762 **Learning**

763 School boards, working within their responsibilities, play an important role in supporting  
764 administrators and teachers to increase instructional knowledge and skills. When the  
765 board aligns its governance responsibilities and focuses on goals to increase students'  
766 mathematical understanding and success, district structures and resources strengthen  
767 administrative leadership.

768 Administrators play a key role in helping create and sustain a multilayered system of  
769 support for teachers in their pedagogy and professional learning. There are several  
770 dimensions to the types of specific support administrators can provide, including having  
771 well-informed conversations with teachers about instruction and assessment and giving  
772 teachers feedback on instruction.

773 Together with their teaching staff and paraeducators, administrators may need to seek  
774 opportunities to understand more about the nature of mathematics learning and  
775 teaching presented in this framework. Leadership beliefs regarding mathematics  
776 instruction should be reconsidered. For example, maintaining beliefs such as “fidelity to  
777 the curriculum” can undermine the focus and coherence called for in chapter 1. It is  
778 critical that clarity about focus, coherence, and rigor in mathematics be communicated  
779 at district, school, and department levels. Addressing policies and practices around  
780 course offerings, placement, and de-tracking are essential conversations to be had at all  
781 levels.

782 Unlike teachers, administrators are in a unique position to support and enact changes  
783 on a program level, rather than focus solely on the classroom. Administrators should  
784 provide support for discussions on district- and school-wide changes in practices and on  
785 policies that can result in more equitable mathematics learning outcomes for all  
786 students. In establishing and maintaining regular communication with teachers about  
787 their teaching, their students, and the curriculum, administrators play a pivotal role in  
788 instilling the confidence and vision necessary to help teachers explore new ways of

789 ensuring all students can engage with mathematics. The guidance presented in this  
790 framework can serve as a starting point in helping to structure these conversations.

791 Administrators should be aware of this framework's responses to the challenge posed  
792 by the principle of coherence. The big ideas of mathematics unfold in progressions  
793 across grades (thus, grade-band chapters rather than individual grade chapters), and  
794 are taught by way of intriguing investigations with relevance to students' lives. The  
795 learning progressions chapters (chapters 3, 4, and 5) highlight the value in building  
796 powerful ideas about numbers and data whose meaning grows clearer over time and  
797 resonates with each subsequent grades' topics. Learning is focused on building  
798 productive habits of mind such as exploration, discovery, and communication involving  
799 mathematics.

800 Administrators should also be aware of the general principles guiding the development  
801 of the grade-band chapters (chapters 6, 7, and 8). These include designing lessons  
802 from a small number of big ideas in each grade band; spending a preponderance of  
803 student time on authentic problems that engage multiple content and practice standards  
804 situated within one or more big ideas; focusing on connections, to students' lives and  
805 among mathematical ideas; and using teaching strategies that show connections  
806 between different mathematical ideas on various topics across grade levels.

807 Working with their teaching staff, administrators may need to identify opportunities to  
808 learn more about inclusive teaching strategies. Chapter 2 sets out the important  
809 qualities of mathematics classrooms that encourage student engagement and equitable  
810 outcomes. Through professional workshops, conferences, or other professional  
811 learning, administrators can support teachers in learning to use engaging, equitable  
812 strategies. Partnerships with parents, families, and caregivers can also provide valuable  
813 opportunities for administrators as they work with teachers in addressing the totality of  
814 students' learning experiences. Family partnerships and experiences, especially given  
815 families' cultural and linguistical diversity, can create rich avenues for professional  
816 learning for teachers and teacher leaders. Administrators should also draw on teacher  
817 leaders at their school site or within their district who can provide support and

818 knowledge of inclusive teaching approaches, especially those that focus on cultural and  
819 linguistic diversity and on students with learning differences.

820 An important idea conveyed in this framework is that all students deserve access to a  
821 high-level mathematics curriculum. The chapter on data science (chapter 5) discusses  
822 ideas that will be new to many administrators about how to support students' learning of  
823 statistics and data science from elementary through high school. Classroom use of real  
824 data relevant to students' lives, and the encouragement of students to ask questions it  
825 raises in their minds has the potential to broaden STEM participation and make  
826 mathematical learning more equitable. Holding equity as a guiding principle and working  
827 to encourage equitable participation in new courses is paramount for administrators as  
828 new courses are developed and introduced.

829 Administrators are urged to read all of chapter 9 as they engage in conversations with  
830 teachers, school boards, and parents on the ramifications of acceleration and tracking.  
831 They need to work with these same groups to carefully consider the many alternatives  
832 to tracking that afford better access to higher-level mathematics for all learners, as  
833 discussed in chapter 9.

834 The instructional vignettes in the framework can help administrators develop an  
835 awareness of the different teaching strategies and classroom conversations that provide  
836 opportunities to improve professional practice. Such vignettes also encourage  
837 administrators to reflect on the ways they can nurture these types of experiences for  
838 their mathematics teachers. The vignettes highlight the central role of classroom  
839 discourse and rich, open tasks in teaching and learning mathematics.

840 One key perspective for administrators to recognize is that standards-driven instruction  
841 does not mean that each task results in the learning of a single standard. In fact,  
842 multiple standards can often be learned through engagement with rich tasks with  
843 multiple access points as called for in chapter 2. And mastery-based assessment at the  
844 "big idea" level, as described in chapter 12, helps to reinforce the experience of  
845 mathematics as a sense-making, relevant activity. Administrators who understand that  
846 exploring a big idea through a single, rich task provides opportunities for students to

847 communicate their thinking with their peers and their teacher also understand that this  
848 approach to instruction often results in the learning of multiple standards—and does so  
849 in ways that foster both a positive disposition toward mathematics and learning that  
850 lasts.

851 Additionally, administrators must acknowledge the inequities often perpetuated through  
852 traditional assessment strategies in the mathematics classroom and how these  
853 assessment approaches can be re-envisioned (as described in chapter 12) to provide a  
854 balanced approach in assessing the effectiveness of mathematics instruction.

855 Administrators should look critically at program data to determine where their districts  
856 need to focus more attention to ensure equitable access to mathematics throughout the  
857 grades and enable students from all backgrounds to succeed. Transcript analysis and  
858 course-taking patterns, correlated with metrics of achievement, provide a broader view  
859 of student success than solely focusing on exam achievement. The results of multiple  
860 assessment strategies—rather than a single score on a test—reflect a more complete  
861 understanding of student learning. Standards-based assessment provides an approach  
862 to grading that focuses learning on standards and mastery rather than emphasizing  
863 grade ranges or percentages. Broadened approaches to assessment in a district/school  
864 often mean that administrators prioritize participation in ongoing professional learning  
865 on the topic of mathematics education and assessment of learning. Administrators can  
866 leverage their understanding and use of the Multi-Tiered System of Support (MTSS,  
867 CDE, n.d.) by supporting teachers in aspects of MTSS implementation, such as  
868 integration of instruction with intervention and a focus on continuous improvement.

869 Several ways that administrators can help support and incentivize effective professional  
870 learning are outlined in “Effective Teacher Professional Development” (Darling-  
871 Hammond, Hylar, and Gardner, 2017):

- 872 1. Since a critical component of rich learning is the planning time and pedagogical  
873 knowledge necessary to facilitate an active mathematics learning environment,  
874 administrators should prioritize time for professional learning and collaboration  
875 when designing schedules. Professional learning communities, peer coaching

876 and observations across classrooms, and collaborative planning all provide  
877 important opportunities for educator learning.

- 878 2. Periodic needs assessments (at the school or district level) use staff surveys to  
879 identify areas of professional learning that educators desire and need most. Such  
880 routines help ensure that professional learning is connected to practice and  
881 makes an impact on practice much more likely.
- 882 3. District and school administrators should identify and develop expert teachers as  
883 mentors and coaches to support the professional learning of other educators.  
884 These expert teachers need their own support, structure, and professional  
885 learning in order to be effective.
- 886 4. Districts and schools should ensure that professional learning opportunities are  
887 integrated with efforts to implement legal requirements, such as the Every  
888 Student Succeeds Act (ESSA) school improvement initiatives. Mandates, such  
889 as the use of data to inform instruction and the creation of positive and inclusive  
890 learning environments, tend only to be effective when educators experience them  
891 as supportive of their efforts to improve classroom practice, as opposed to  
892 compliance exercises that add more paperwork to busy days.
- 893 5. To address professional learning needs of rural communities and to develop  
894 intra-district and intra-school collaboration, Titles II and IV of ESSA should be  
895 used to support technology-facilitated opportunities for professional learning and  
896 coaching.
- 897 6. District and school administrators can seek funding that supports professional  
898 learning opportunities and ensure that these opportunities earn continuing  
899 education units. These opportunities can include many of the types listed below,  
900 such as institutes, workshops, mathematics-specific conferences, and seminars,  
901 and also sustained engagement in collaboration, mentoring, and coaching.  
902 Possible funding sources include Local Control Accountability Plans, state and  
903 federal grant programs, community/business partnerships, and foundations.

904 Some specific resources to aid instructional leaders in supporting quality mathematics  
905 instruction include organizations that are available to partner with schools, as well as  
906 observation and planning guides. These organizations and tools enable administrators

907 to convey high expectations for mathematics instruction—expectations made attainable  
908 by providing teachers with resources, including time for planning lessons, professional  
909 learning, and collaboration. These expectations focus on and align with agreed-upon  
910 school-wide priorities and strategies. As teachers implement their plans, administrators  
911 can provide constructive, informative feedback that builds on teachers’ strengths. In  
912 collaborating with teachers around lessons, administrators can engage teachers in  
913 frequent, productive conversations about mathematics teaching and provide relevant  
914 feedback on instructional practices.

915 By contrast, the general pattern in many California schools is for a classroom teacher to  
916 be observed formally once a year—a practice that is insufficient for administrators to  
917 gain an understanding of teachers’ instruction and insights on how to support it. Instead,  
918 scheduling frequent and sustained interaction with teachers improves administrators’  
919 engagement with students and teachers. Routine interaction allows administrators to  
920 glean a more complete picture of the instructional practices used by their teachers and  
921 determine the kind of support that would bring about positive growth.

## 922 **Role of Parents, Guardians, and Families**

923 While the school classroom is a primary learning environment for mathematics  
924 education, home and community also play significant roles. Through involvement at  
925 every level, parents, guardians, and families can motivate students to develop a lifelong  
926 appreciation of mathematics learning. Families can also provide a supportive home  
927 setting for students to learn and prepare for school. Partnering with parents, guardians,  
928 and families in understanding and supporting authentic mathematics education and  
929 active learning pedagogy is key.

930 A substantial body of research asserts that “effective family engagement depends on  
931 the close working relationships between teachers and each child’s family (Niebuhr,  
932 Arseo, and Simeon, 2021) and that these relationships require building capacity among  
933 families and educators. As happened during the global pandemic of 2020–21, families  
934 can support learning as “co-creators, supporters, encouragers, monitors, advocates,

935 and models” (Mapp and Bergman, 2019). Families are key in supporting the  
936 development of future mathematicians by increasing students’ confidence, developing a  
937 growth mindset, providing examples of math applied to real-life situations, and providing  
938 out-of-school activities. Creating a bridge between children and their families helps  
939 children to deepen their connection to their learning and be more successful  
940 academically.

941 The passage below from *Black, Indigenous, and Latinx Parents as Partners in*  
942 *Mathematics Education* by TODOS: Mathematics for ALL (2020) provides insights about  
943 the assets parents bring when invited into the teaching and learning process:

944 Black, Indigenous, and Latinx parents have a lot to offer classrooms.  
945 However, they are not always asked to join and be a part of the instruction.  
946 Ishimaru, Barajas-López, and Bang (2105) have argued for the involvement  
947 of parents from nondominant groups in schooling, not as passive recipients  
948 of knowledge but as “expert collaborators and fellow leaders.” (p. 14). Given  
949 our current expectation of online and hybrid classes, schools can develop  
950 an online learning culture leveraging school/home connections that support  
951 mathematics identity and agency for students and parents. Research on  
952 Latinx parents visiting classrooms suggests that observations and debriefs  
953 of classroom visits were one way that parents were able to both reflect on  
954 ways to support their students and develop leadership in mathematics  
955 education (Civil and Menéndez, 2012).

956 Because the CA CCSSM and this framework present mathematics instruction that is  
957 significantly different from what many parents experienced as students, it is critical to  
958 educate parents and guardians about what to expect and about the reasons and  
959 research behind the changes. Educating and engaging parents and guardians should  
960 include opportunities for them to experience rich, authentic, culturally sustaining  
961 mathematical tasks in active-learning ways (including support for parents who speak  
962 languages other than English), not simply written descriptions of it. Validating and  
963 valuing parents’, guardians’, and families’ central contributions to education is enhanced

964 when they have opportunities to use their own language, culture, and knowledge  
965 through relevant experiences rooted in the school context.

966 Furthermore, parents and guardians who become more knowledgeable through such  
967 experiences can more effectively support students' learning beyond the classroom.  
968 Parents and guardians can monitor their student's progress not just for content  
969 knowledge, but for understanding of and engagement in mathematical practices or a  
970 developing inclination to use mathematics to make sense of their world. Parents and  
971 guardians can also foster social interactions (e.g., by providing support for collaborative  
972 classroom or out-of-classroom projects) and become involved in educational activities  
973 promoted at the school site (e.g., math fairs and math clubs). Finally, in addition to  
974 coordinating social events, parents may advocate for their children's appropriate class  
975 placement with school academic counselors. Often this happens as students transition  
976 to middle and high school.

977 A model to support the development of family and school partnerships is the National  
978 Parent Teacher Association (PTA), which has developed standards for Family-School  
979 Partnerships. These standards focus on several aspects of the partnership, providing  
980 recommendations on how to foster trust and effective communication to support student  
981 success. In addition to the standards, the National PTA has developed a guide that  
982 provides a rubric with examples for what family–school partnerships look like at the  
983 emerging, progressing, and excelling levels. Parents, guardians, families, and school  
984 leaders may want to use these examples to evaluate and enhance the family–school  
985 collaboration at their school. Specifically, involving parents who have a background in  
986 mathematics (including in such areas as the building trades and cooking, as well as  
987 more traditional STEM areas) will help develop partnerships with the community that  
988 can provide much-needed support for classroom instruction.

989 Acknowledging cultural differences can further help educators include families as allies.  
990 It also provides educators with the opportunity to reinforce the importance of big picture  
991 ideas and to diminish formulaic thinking. For example, parents and guardians whose  
992 own schooling was in another country might possess different ways of solving

993 mathematical problems. They may be hesitant to get involved in their student’s  
994 mathematical learning for fear of teaching them “incorrectly” or differently from the  
995 approaches used in their student’s classroom.

996 The California *ELA/ELD Framework* provides specific suggestions for parent, guardian,  
997 and family involvement when those families speak a language other than English or are  
998 new to the United States. For example, parents who have experience with mathematics  
999 and speak a home language that students also speak can provide welcome and  
1000 beneficial support for the parents of those students who are not as experienced with  
1001 mathematics (CDE, 2014, Chapter 11).

## 1002 **Collaboration Among Partners and Communities**

1003 As the sections above explain, a universe of partners and communities is involved in  
1004 mathematics education, and they need to be aligned and work collaboratively. Teachers  
1005 perform incredibly complex work that relies on thousands of instructional decisions  
1006 every day (Ball, 2018). They need to understand their students’ thinking, choose tasks,  
1007 decide which questions to pose in discussion, select which (and whose) lines of inquiry  
1008 to pursue with the class, and ensure that tasks and context are authentic and culturally  
1009 relevant for all students. When educational partners and influencers outside of the  
1010 classroom are not aligned—for example when a textbook does not align with the vision  
1011 of classroom instruction—the work of teaching is made even more difficult, and  
1012 improvement in instructional practice is impeded.

1013 While implementation of the CA CCSSM has led to significant instructional change, the  
1014 iterative nature of teaching means that improvement of mathematics teaching and  
1015 learning is continuous. The many educational partners and communities whose efforts  
1016 need to be aligned include (adapted from the *California Science Framework*, 2016):

- 1017 ● Teachers and teacher leaders prepared to engage in student-centered teaching  
1018 that engages students in equity-oriented learning through authentic tasks and  
1019 contexts that are relevant to those students based on their choices, interests, and  
1020 aspirations

- 1021 ● School, district, and county office administrators who are knowledgeable and  
1022 supportive of the changes demanded by the CA CCSSM and this framework
- 1023 ● Afterschool, early childhood, and other expanded learning opportunities aligned  
1024 with and supportive of authentic mathematics learning that include collaborative  
1025 and coherent efforts between teachers and other education support professionals
- 1026 ● College and university faculty involved in and advocating for high-quality  
1027 mathematics instruction and preparation of future teachers
- 1028 ● Community members and parents, guardians, and families who understand the  
1029 reasons for and are supportive of engaging in equitable approaches to  
1030 mathematics teaching and learning
- 1031 ● Formal and informal learning environments, including museums, libraries,  
1032 science centers, and other venues that are fully committed to supporting the CA  
1033 CCSSM

1034 Effective progress takes place when these partners and communities are aligned and  
1035 work collaboratively within an ongoing cycle of implementation, reflection, and  
1036 improvement of practice (Fixsen and Blase, 2009; Fixsen et al., 2005; Little, 2006;  
1037 Penuel, Harris, and DeBarger, 2015). The vision is for teachers and other educational  
1038 partners to engage in a learning community that has the same characteristics—respect,  
1039 commitment, intellectual engagement, and motivation toward continuous  
1040 improvement—that all educators hope to create for students in California classrooms.

1041 Ermeling and Gallimore (2013) present models of continuous improvement that have  
1042 been embedded in school learning communities across 40 districts. These models focus  
1043 on addressing learning needs common to community members; using analysis of  
1044 evidence to drive planning and decision making; and critically questioning practices. To  
1045 be effective, the learning community must operate in an environment of collaboration  
1046 and trust among teachers and school leaders, each of whom recognize that  
1047 improvement requires time, resources, continuous support, and an appreciation of risk-  
1048 taking as new instructional approaches are implemented.

1049 Improvement efforts in mathematics teaching and learning should focus on the  
1050 sustainability of improved instructional practices and education programs as well as the  
1051 sustainability of the professional learning cycle itself. This requires fostering a  
1052 collaborative school culture that routinely engages educators, administrators, students,  
1053 parents, guardians, families, education professionals, and community members (Fixsen  
1054 and Blase, 2009). Such a culture allows all educational partners to understand  
1055 themselves as advocates and supporters in the effort to improve students' experience  
1056 and achievement in mathematics.

1057 Finally, as discussed above, continuous improvement calls for teachers and educational  
1058 leaders to examine personal beliefs and attitudes toward students and their families  
1059 (CDE, 2014). Explicit reflection helps educators approach all students with a growth  
1060 mindset disposition that both values the cultural resources and linguistic assets students  
1061 bring to the mathematics classroom and supports them to use these resources while  
1062 expanding and adding new perspectives and ways of appropriating and using  
1063 mathematics. Teachers' beliefs about their students significantly affect those students'  
1064 motivation, experience, and achievement (Heyder et al., 2020; Stipek et al., 2001).

## 1065 **Conclusion**

1066 A broad system of support to enable all students to succeed in mathematics learning  
1067 consists of many interconnected parts. Teachers, as the drivers of learning, continually  
1068 refine and adapt their practice to address the many dimensions of creating a rich  
1069 mathematical learning environment focused on active learning for all students in their  
1070 classrooms. By supporting teachers with the resources, time, insight, and  
1071 encouragement to become ever-more effective practitioners of their craft, administrators  
1072 serve a critical role in the system. The elements for effective professional development  
1073 described in this chapter provide administrators and other stakeholders with guidance  
1074 on creating high-quality learning experiences for teachers, and the examples listed are  
1075 a small sampling of the variety of professional development experiences available.  
1076 Supporting teachers, both in their own learning and in their teaching, ultimately supports  
1077 the students who rely on these teachers.
