## 28 **Purpose of Technology in Mathematics Learning**

29 The California Common Core State Standards for Mathematics (CA CCSSM) state, and  
30 this document describes, that the “learning of mathematics” is two-fold: the learning of  
31 grade-level content standards, and the learning of standards for mathematical practice.  
32 This chapter advocates for technology use which supports both the learning of  
33 meaningful mathematical content and the fostering of the productive habits of mind and  
34 habits of interaction embodied by the Standards for Mathematical Practice (SMPs). This  
35 first section describes the purpose of technology in the learning of mathematics, the  
36 second section introduces overarching principles meant to guide such technology use,  
37 and the third section provides general guidance for distance learning which is applicable,  
38 but not limited, to mathematics instruction. Additionally, to support schools in the  
39 effective implementation of technology to support learning, the *California Digital Learning*

40 *Integration and Standards Guidance* (CA DLI&SG, CDE, 2021) provides strategies to  
41 build educator and system capacity. The standards guidance is intended to support  
42 teachers as they implement mathematics instruction. (See the Digital Learning section in  
43 this chapter for more information on the CA DLI&SG document).

44 Technology use in the teaching of mathematics has one primary purpose: To facilitate  
45 interactive experiences that enrich the learning of both content standards and SMPs.  
46 Given the increasingly integral role that technology plays in commercial, societal, and  
47 cultural aims, the use of technology in educational settings likewise reflects the progress  
48 toward an informed and technologically-skilled society. While introducing students to  
49 technology is certainly important in and of itself—and can even be a necessity (see the  
50 Distance Learning section)—it can be accomplished in service to the primary purpose  
51 described above. In other words, this chapter provides guidance on how technology use  
52 can best support mathematics instructional objectives, rather than adjusting instructional  
53 objectives to support the use of technology.

## 54 **Technological Pedagogical Content Knowledge Framework**

55 The Association for Mathematics Teacher Educators (AMTE) in 2009 published a  
56 framework for research and guidance on best practice in the use of technology in  
57 mathematics education. Technological pedagogical content knowledge (TPACK), based  
58 on the work of Mishra and Koehler (2006), is a specialized type of knowledge and skills  
59 that enables an educator to draw upon content knowledge (knowledge of mathematics),  
60 technological knowledge (knowledge of, and facility with, relevant technology) and  
61 pedagogical knowledge (knowledge of teaching and learning strategies) as they create  
62 meaningful learning experiences for students. In short, this knowledge is the synthesis of  
63 three areas of expertise for educators: mathematics, teaching, and technology. Thus, the  
64 guidance in this chapter is designed to establish and increase this type of knowledge. An  
65 illustration of those relationships between these types of knowledge is shown in Figure  
66 11.1 below.

67 Figure 11.1: Technological Pedagogical Content Knowledge Model

68

69 [Link to long description](#)

70 Source: Koehler and Mishra, 2009.

71 According to the TPACK Framework, educators with robust technological pedagogical  
 72 content knowledge are able to do the following:

- 73 a. Incorporate knowledge of learner characteristics, orientation, and thinking to foster
- 74 learning of mathematics with technology;
- 75 b. Facilitate technology-enriched, mathematical experiences that foster creativity,
- 76 develop conceptual understanding, and cultivate higher order thinking skills;
- 77 c. Promote mathematical discourse between and among instructors and learners in
- 78 a technology-enriched learning community;
- 79 d. Use technology to support learner-centered strategies that address the diverse
- 80 needs of all learners of mathematics; and
- 81 e. Encourage learners to become responsible for and reflect upon their own
- 82 technology-enriched mathematics learning.

83 Although the behaviors seen above are characteristics of some educators in California,  
84 for many they are aspirational, especially for those in rural areas where access to and  
85 support for use of technology is more limited. Teachers, administrators, district and  
86 county staff, should work together in supporting the growth of the technological  
87 pedagogical knowledge described in the behaviors above.

## 88 **Principles for Technology Use in Mathematics Learning**

89 The following principles are meant to guide effective incorporation of technology into the  
90 teaching of mathematics. This section addresses uses of technology that support  
91 mathematics learning specifically; uses of technology supporting remote learning in  
92 general are discussed in a later section. While technology use varies widely, these  
93 principles can serve as guideposts for all districts and schools as they consider utilizing  
94 various technologies to support learning.

### 95 **Principle 1: Strategic Use of Technology in a Learning Environment** 96 **Can Facilitate Powerful Learning of Mathematics.**

97 According to the National Council of Teachers of Mathematics (2015), the **strategic use**  
98 **of technology** in the teaching and learning of mathematics is the use of digital and  
99 physical tools by students and teachers in thoughtfully designed ways and at carefully  
100 determined times so that the capabilities of the technology enhance how students and  
101 educators learn, experience, communicate, and do mathematics. Strategic use of  
102 technology supports all students in their learning and is consistent with research on best  
103 practices in teaching and learning.

104 A **technology-rich environment**, when used strategically, can be a powerful tool for  
105 learning deeper mathematics. A technology-rich environment is one in which the  
106 technology serves a clearly defined pedagogical purpose (Zinger et al., 2017). In  
107 establishing a technology-rich environment for learners, three primary factors must be  
108 taken into account: access, usage, and skills (ITU, 2009). **Access** refers to the  
109 availability of technology for teachers and learners, **usage** refers to its prevalence in  
110 learning experiences, and **skills** refers to the knowledge level required, both for teachers  
111 and for students, to use the technology appropriately. In considering whether or not to

112 use specific technology, each of these factors can help guide educators' decisions. For  
113 example, if all students have *access* to a particular technology, and the teacher has the  
114 *skills* and support to enable learning which relies upon the technology, but future  
115 coursework relies upon different technology, then this difference in *usage* should be  
116 considered before adopting the technology.

117 By contrast, a **technocentrist** educational approach is one in which technology is  
118 considered both a means and an end (Zinger, Tate, and Warschauer, 2017). In other  
119 words, the aim of a technocentrist approach is to train learners in using technologies with  
120 the hope that learners would use new knowledge of technologies readily outside of the  
121 classroom or in future learning situations. This approach, focused on technological  
122 learning rather than content-area learning, has been found to be ineffective in large-  
123 scale projects (Zinger et al., 2017).

#### 124 **Portrait of a Technology-Rich Setting**

- 125 ● All students have access to a particular technology intended to support specific  
126 mathematics content and practices. All families have access to appropriate  
127 technology and support to be an active part of the overall school community.  
128 (access)
- 129 ● Teachers have knowledge about the pedagogical use of the technology—for  
130 example, through appropriate professional learning. (skills)
- 131 ● The lesson, task, or activity relies upon the technology as an integral part of  
132 students' interactions with the content. (usage)

#### 133 **National Council of Teachers of Mathematics Recommendations**

134 According to the National Council of Teachers of Mathematics (NCTM), two types of  
135 technologies can support teachers in creating learning environments for students:  
136 **content-specific mathematics technologies** and **content-neutral technologies**  
137 (National Council of Teachers of Mathematics, 2015). **Content specific technologies**  
138 support students in exploring and identifying mathematical concepts and relationships.  
139 These include computation/visualization programs, such as Desmos or Geogebra, or  
140 virtual manipulatives or games, and calculation. **Content-neutral technologies**, such as  
141 spreadsheets, word processors, and drawing programs, both online and offline, help

142 students collaborate with peers and communicate work with teachers. Both types of  
143 these technologies support students in learning mathematics content and practicing  
144 skills, and develops higher-order thinking skills such as visualizing, reasoning, and  
145 problem solving.

146 NCTM recommends the following guidance on the strategic use of technology:

- 147 ● Mathematics constitutes the focus of instruction and drives the use of the  
148 technology. Teachers capitalize on the capabilities of technology to accomplish  
149 mathematics learning goals. As research has consistently pointed out (Reys and  
150 Arbaugh, 2001), calculator use does not hinder the learning of rich mathematics. It  
151 does hinder the learning of procedural mathematics, however, especially when  
152 that is believed to be the primary objective. In considering the use of technology,  
153 the belief that rote algorithms and procedural skills (which are easily replaced by  
154 calculators) are the most important mathematics to be learned which must be  
155 reconsidered. Students learn to negotiate the use of technology in ways that  
156 facilitate larger aims only when they are given larger aims to accomplish with the  
157 technology.
- 158 ● Strategic use does not imply continuous use. Teachers should carefully consider  
159 when and how often to rely upon technology in learning experiences. Although  
160 technology mediates a major portion of each day in distance learning  
161 environments (see the second half of this chapter), teachers in these situations  
162 should still be mindful of over reliance on certain forms of technology when other  
163 skills may need fostering. For example, students should, at times, draw lines on a  
164 coordinate grid on paper using a ruler instead of always using an online graphing  
165 system. This helps develop fine motor skills and encourages attending to  
166 precision (SMP.6) in a manner similar to drawing geometry shapes by hand. Or, in  
167 encouraging the development of number sense, teachers may wish to have  
168 students focus on mental math strategies such as “making ten” and composing or  
169 decomposing numbers. Pan balances are another example which encourage  
170 students’ ability to visualize maintaining balance by “disappearing” equal  
171 quantities from both sides of a balance as a valuable precursor to solving linear  
172 equations. In simply combining terms, supported by technology or not, without  
173 considering equations in their totality, students can lose sight of the larger aims of

174 what they are doing much of the time. Teachers can support students by modeling  
175 deliberate use of technology only after a problem is considered thoughtfully at  
176 first.

177 ● Teachers can meaningfully connect technology use in classroom learning to the  
178 use of technology on state and local assessments. When technology use is  
179 interwoven with learning throughout the school year, students can familiarize  
180 themselves with methods of recording and capturing their thinking. This comfort  
181 can also inherently support students' familiarity with the technological demands of  
182 the California Assessment for Student Progress and Performance (CAASPP). In  
183 distance learning environments, assessment often takes many more forms than it  
184 would if it culminated solely in computer-based exams. For example, students can  
185 view and compile portfolios of their work for a unit or quarter in the school's  
186 learning management system, and record a video reflecting upon their progress.  
187 Formative assessment, both in face-to-face and remote learning situations, is a  
188 powerful driver for learning, see Chapter 12 and research-based Distance  
189 Learning Principle 6 below.

190 ***Sample Task: Rescue Rover (Integrated Math II/Mathematics: Investigating***  
191 ***and Connecting II)***

192

193 To teacher:

194 This activity promotes understanding of G-SRT-8, F-BF-1, A-REI-4, A-CED-1, 2, 3, and  
195 SMPs 1, 3, 4, and 5, as well as the Next Generation Science Standards and Science and  
196 Engineering Practices. The activity is designed for students working in heterogeneous  
197 teams of four members. Teachers should be mindful of students' personalities and work  
198 habits when assigning them into groups in order to achieve effective cooperation and

199 collaboration, and use individual discretion if frontloading additional scientific vocabulary,  
200 such as terms based in geology or science technology.

201 To students:

202 You and your team are working on a mission involving the remote collection of scientific  
203 data from the surface of Mars. Two active rovers, Molly and Dixie, are collecting soil  
204 samples, atmospheric data, and any evidence of past organic material.

205 [Incoming]: You suddenly receive a distress signal!

206 Dixie was moving around a rock outcropping and accidentally dislodged a boulder,  
207 pinning it against the rock face. If this is bad enough, Dixie's nuclear power supply is also  
208 damaged. It is currently emitting radiation with increasing intensity. This radiation will  
209 eventually melt Dixie's internal wiring unless the team can remove the emergency  
210 release panel. Based on Dixie's position, control center thinks the rock face is blocking  
211 access to the panel. The situation is truly dire for Dixie and its valuable data!

212 Fortunately, the other rover, Molly, could potentially reach Dixie in time to open the  
213 casing and remove the power supply using its robotic tool armature.

214 Your Team's Tasks:

- 215 • First, determine the specific team goals for this situation.
- 216 • Second, use the map below to list the information your team will need to help  
217 achieve these goals

218 (Note: Each different pattern represents a different terrain on Mars)

219

220 Additional specifics to the mission:

221 There are two main terrains that Molly must traverse to reach Dixie. The first is fairly firm  
 222 bedrock where Molly can average 20 kilometers/hour (km/hr). The second surface is  
 223 rugged gravel and the rover will only average 10 km/hr. Work with your team to clearly  
 224 plot out Molly's path and determine the amount of time it will take to get Molly to Dixie.  
 225 Remember, every minute counts!

- 226 1.  Fairly Firm Bedrock  Rugged Gravel

227 Legend: Each vertical and horizontal unit represents 10 km.

228  
 229 Show all your work and explain your reasoning below.

- 230 a. What is the least amount of time that it takes for Molly to reach Dixie?  
 231 Explain the evidence that supports the shortest time duration that your  
 232 team found.
- 233 b. Is the shortest distance to the settlement a straight path between the two?  
 234 Explain how you know.
- 235 c. Is the shortest distance always the fastest possible path? Explain your  
 236 reasoning.
- 237 d. The control center asks your team to automate this process in case a  
 238 future rover needs to reach another to perform a similar operation.  
 239 Describe what parts of your solution process could be programmed. What  
 240 parameters would there be?

241 Implementation:

242 After students unpack the problem and determine different points on the x-axis at which  
243 Molly crosses from one terrain to the other, there will be different time durations for the  
244 entire journey. So, in order to minimize the time, they must find the point on the border  
245 between terrains which gives the least time.

246 Technology Meets the Challenge:

247 Because calculating distances using the distance formula and dividing by Molly's rate to  
248 find the time for that leg of the journey is tedious work by hand for each point chosen,  
249 students can divide this work among the team by having each member calculate the total  
250 time for a point of their choosing. Then another team member can pick a different point,  
251 and so on. But what if there were three types of terrain, or five, or 10? The case for using  
252 technology to automate these processes is easily made at this point, and is at the heart  
253 of NCTM's first recommendation: Mathematics is the focus of instruction and drives the  
254 use of the technology. Teachers capitalize on the capabilities of technology to  
255 accomplish mathematics learning goals. Because optimizing for time involves some fairly  
256 complicated calculus, the use of technology can enable students to automate their  
257 processes and find the minimum distance.

258 An open-source software program that enables modeling of blended algebra and  
259 geometry problems is Geogebra, which works in browsers and as an app. The teacher  
260 can encourage students to set up the diagram on Geogebra, with points representing the  
261 locations of Molly and Dixie. They can then place a free point on the border and use the  
262 distance function to output the total distance. Using the algebra command lines, the time  
263 for the first "leg" (from Molly to border point) can be programmed in as the quotient of the  
264 distance divided by Molly's rate in the bedrock. Similarly, the time for the second "leg"  
265 (from border point to Dixie) can be found. These times can then be totaled to find the  
266 total time, a figure which can be adjusted by grabbing and moving the border point along  
267 the border until the minimum time is found. The result is thousands of calculations in an  
268 instant! Students can discuss and explore variations on this design, such as different  
269 initial starting points for Molly and Dixie, various other terrains and different rates of  
270 travel, elevation changes, and others. In this way, students have a different  
271 understanding of the importance of the key mathematical relationships between time,

272 distance, and speed since they must use these relationships in creating their model to  
273 answer questions.

## 274 **Principle 2: Support for Teachers of Mathematics Accompanies Use of** 275 **Learning Technologies**

276 Supporting teachers in their pedagogical development is the most critical part of effecting  
277 positive change in students' learning experiences. This chapter recommends the  
278 adoption of technology only when it is accompanied by changes to teaching practices  
279 which make the technology an integral and sustained component of the instruction, and  
280 when ongoing support can be provided to teachers. In a nutshell, instructional purpose  
281 should drive the use of technology, and not vice versa.

282 Administrators play a pivotal role in supporting teachers as they explore, adopt, and  
283 implement new technologies in their instructional practice. Introducing technology use  
284 into students' learning experiences requires consideration of a school's mission, values,  
285 and budget; and active communication amongst school and district personnel. Parents,  
286 caregivers, and families also represent a critical audience when considering technology  
287 awareness and education, especially with regards to distance learning. Below are  
288 guidelines to inform administrators and policymakers in state, county, district and school  
289 offices as they support teachers in strategic uses of technology:

- 290 ● Adoption of technology occurs only when it is accompanied by changes to  
291 teaching practices which make the technology an integral and sustained  
292 component of the instruction, and when ongoing support can be provided to  
293 teachers. Technologies can have short half-lives; restraint should be exercised in  
294 adoption of technologies popular in the moment.
- 295 ● Time is provided to teachers to explore particular technologies to learn, reflect  
296 upon, and integrate technology into learning experiences for students. This is  
297 critical for all technology, as it is a hard lesson to have technology fail to work, or  
298 work improperly, at the point of students' experiences with it. Delays, pauses,  
299 system updates, and the like can sabotage momentum in the flow of instruction.
- 300 ● Technology support for teachers is ongoing and readily available. This support  
301 can take the form of workshops, peer collaboration, conference attendance, virtual

302 meetings, but of critical importance is that this time be provided and incentivized.  
303 In particular, the encouragement and support of peers is of great benefit as  
304 teachers expand their knowledge of strategic technology use.

- 305 ● Effective professional development focused on the use of technology in  
306 mathematics learning is differentiated, reflecting the multitude of knowledge and  
307 comfort levels that teachers have with regards to technology. A successful plan  
308 for professional development recognizes that for teachers to learn to use  
309 technology in ways that enhance and increase student learning, they must go  
310 through “a process of entry, adoption, adaptation, appropriation, and invention as  
311 they navigate through the integration of technology in their classrooms” (Zinger,  
312 2017).
- 313 ● To avoid overwhelming teachers, and in deference to the multitude of knowledge  
314 and comfort levels they have, training should focus on one tool, or aspect of one  
315 system, at a time. After teachers are given opportunities to implement in their  
316 classes, then further tools can be introduced (Zheng et al., 2014).
- 317 ● Professional development includes specific criteria for teachers to rely upon as  
318 they select worthwhile applications, games, or other software that can accomplish  
319 learning objectives.
- 320 ● Strategies that help support English learners while accessing tasks, for example:  
321 identifying and clarifying terms used in the task (e.g., atmospheric data, organic  
322 material, rock outcropping) are incorporated into professional development  
323 programs.

### 324 **Principle 3: Learning Technologies Are Accessible for All Students.**

325 Technology use in mathematics classrooms must contribute to making the mathematics  
326 community more equitable. Thus, administrators and teachers must give special  
327 attention to issues of access when designing instructional uses of technology. In general,  
328 a key consideration is in exacerbating the “digital divide,” the gap in knowledge and skills  
329 between populations of students which have access to technology, usually through  
330 wealth and privilege, and those that do not. Reducing, rather than widening, the divide  
331 should be an effect of well-designed uses of technology in schooling. For a particular  
332 technological tool, other considerations include:

- 333 ● The linguistic or cultural assumptions embedded in the technological tool under  
334 consideration. Is the tool designed with a particular student profile in mind, thus  
335 disadvantaging students who don't fit that profile? If so, another tool should be  
336 found or the existing tool modified to address these issues.
- 337 ● Differences in prior exposure to related technology—perhaps necessitating  
338 different supports for different students. Appropriate and equitable supports must  
339 be provided to provide equal access for all.
- 340 ● Providing the necessary classroom materials for technology use, both hardware  
341 and software.
- 342 ● Providing initial and ongoing technology support that is readily available to  
343 students, even in rural and remote settings. Technology can be used as a vehicle  
344 to better understand the students, their interests, and other culturally-relevant  
345 information, as it relates to equity. For example, polling students can provide  
346 teachers with immediate information regarding their students' interests, thus  
347 enabling teachers to vary activities which can then engage the interests of more of  
348 their students. Surveys also provide an easy, anonymous way to conduct  
349 formative assessment (i.e., reading checks or to gauge student comfort level for  
350 particular concepts).
- 351 ● Allowing for widely varying levels of internet capabilities and connection speeds  
352 among students and their families, including limited device or internet availability  
353 or rural internet capabilities and potential outages/interruptions.
- 354 ● Aligning technology use to create equitable learning experiences using  
355 assessment platform technology. For example, affording class time for students to  
356 become familiar with the Smarter Balanced interface and the kinds of resources  
357 used in the administration of the CAASPP (CDE, n.d.a).

358 ***Vignette: Polygon Properties Puzzles (Grade 4)***

359 Students in Ms. Thompson's grade four class have been exploring the attributes of  
360 polygons. They have compared and contrasted physical models and illustrations of  
361 polygons, attending to features such as angle size, number of sides, and whether the  
362 figures have any parallel or perpendicular sides. Lessons have included polygons that  
363 students view as "typical" as well as atypical examples. Today, Ms. Thompson will ask

364 her students to draw polygons that meet specific criteria as a way to show their  
365 understanding. Her planning is informed by an adaptation of five challenges from *About*  
366 *Teaching Mathematics* (Burns, 2007). Students will illustrate the figures using  
367 technology, specifically Whiteboard. Some of the standards addressed in the lesson  
368 include:

- 369 ● SMP.1, 3, 5, 6, 7
- 370 ● Content Standards: 3.G.1; 4.G.1, 2, 4.MD.5; 5.G.3, 4
- 371 ● English Language Development standards: PI.1; PI.2; PI.3; PI.4; PI.5; PI.9;  
372 PI.12

373 Ms. Thompson is deliberate and selective in the use of technology. She plans to use  
374 Whiteboard for this lesson as she finds it can facilitate the use of mathematical practices  
375 and increase focus on the mathematics content. Her expectation is that this use of  
376 technology will:

- 377 ● reduce the challenge of drawing straight lines by using Whiteboard’s “line” tool;
- 378 ● encourage collaboration and discourse between partners who are sharing one  
379 Chromebook, and later, among the larger group;
- 380 ● support linguistically and culturally diverse students English learners;
- 381 ● support students with learning differences in accessing the tasks and finding  
382 meaning in their learning;
- 383 ● increase engagement for the many students who are enthusiastic users of  
384 technology;
- 385 ● foster growth mindsets and promote the correction of errors and revision of  
386 work in progress;
- 387 ● enable the class to see and compare various student products in a highly  
388 visible, large scale format via Google Casting or the link sharing within  
389 Whiteboard;
- 390 ● use class time efficiently, allowing for full discussion and analysis; and
- 391 ● serve as a quick way to engage in the formative assessment process as  
392 student work is instantly transmitted to the teacher’s view.

393 Ms. Thompson uses Google Classroom (and is familiar with other learning management  
394 systems) and Whiteboard (by the Math Learning Institute) often for lessons. These

395 students have worked in collaborative groups for several months, sharing and explaining  
396 their thinking digitally. They share their work using links or the share code and posting  
397 them into their assignments on Google Classroom. The class has established effective  
398 collaboration protocols (e.g., stay on your own page, let everyone speak, do not delete  
399 others' work, add to someone else's thinking, everyone has equal access to the tool).  
400 Students are arranged in four-person table groups. They know how to partner up and  
401 then switch partners in their table group quickly. The class has a system for Chromebook  
402 management: one partner is responsible for getting two Chromebooks out before the  
403 morning meeting; the second partner returns the devices to the charging station during  
404 afternoon clean-up time.

405 The teacher considered language barriers and the needs of individual students as she  
406 planned partners and heterogeneous groups. Ms. Thompson has 12 English learners in  
407 this class. To support their learning, she:

- 408 ● has placed one Emerging English learner (EL) student with a language proficient  
409 Spanish speaking student to help with translations and collaboration
- 410 ● will create and display sentence frames for this student to use during discussion  
411 and collaboration
- 412 ● provided the seven English learners who are at the Bridging stage and the four  
413 English learners who are at the Expanding level with sentence stems to support  
414 them as they discuss and explain their thinking
- 415 ● has paired a student with an **Individualized Educational Program (IEP)** for  
416 reading with a student who can help them access the written material
- 417 ● situated two students who have IEPs for math with partners who are supportive  
418 and able to share the work equitably and inclusively

419 In this lesson, students will use a familiar classroom routine, "Convince Yourself, a  
420 Friend, a Skeptic." They will:

- 421 1. Solve each problem with a partner (convince yourself)
- 422 2. Justify their mathematical argument to the other pair in their table group, who will  
423 ask questions and encourage further explanation (convince a friend)

424 3. Prepare to convince the class, who will challenge and probe any inconsistencies  
425 (convince a skeptic)

426 Ms. Thompson begins the lesson by focusing attention on an image the class explored  
427 the day before: a square that is not oriented on the horizontal. She asks partners to  
428 describe the figure using precise mathematical terms, as they did in the previous lesson.

429 Students offer many of the terms that emerged in the earlier lesson, which Ms.  
430 Thompson records for the class: *square, rectangle, tilted square, diamond, right angles,*  
431 *square corners, parallel sides, perpendicular, equal side lengths.* Several students raise  
432 their hands to challenge the term “diamond,” arguing that it is an informal term and that  
433 “*a square is still a square, even if it is tilted!*” Ms. Thompson comments that students  
434 have shown they could convince others and could take the role of skeptics; she  
435 encourages them to continue to attend to the properties of polygons in today’s lesson,  
436 too.

437 Ms. Thompson tells the students this time, they will share one Chromebook with their  
438 designated partner, using Whiteboard to illustrate a series of polygons with particular  
439 properties. This causes excitement among her students; almost all are enthusiastic  
440 about using Whiteboard and working with their partners.

441 Ms. Thompson tells the class that they will draw a series of polygons that include specific  
442 properties. As she posts each one, students will read the task aloud together, and then  
443 think quietly about how they might draw the figure. Once they have an idea, they should  
444 show a “thumb up,” to signal that they are ready to start work on the Chromebook. After  
445 partners solve each problem, they must convince the other partners at the table, and  
446 plan to explain and justify their thinking in the whole-class “skeptics” discussion.

447 Ms. Thompson posts Task 1: “Make a triangle with one right angle and no two sides the  
448 same length.”

449 The class reads the statement aloud twice, carefully and slowly. Ms. Thompson signals  
450 for quiet thinking, and watches as students begin responding with thumbs up. When she  
451 is satisfied that partners are ready to begin, she invites them to start illustrating on  
452 Whiteboard.

453 As anticipated, students are successful and confident on the first task, having practiced  
454 by exploring triangles of various types. Ms. Thompson displays four student responses  
455 for the class to consider, selecting examples that are oriented differently. Some students  
456 express surprise about how many different ways the figure can be drawn and still meet  
457 the requirements. Ms. Thompson asks students to talk with their partners, using the  
458 sentence frames as necessary in their role as skeptics, and be ready to question,  
459 challenge, or probe any inconsistencies they note in the triangles displayed. After a few  
460 moments, a few questions/challenges are posed:

- 461 • How can we tell if C has a right angle, when it's "lying down" like that?
- 462 • Is B really a right angle triangle if the right angle is pointing to the left?
- 463 • Convince us about D, too! It's pointing to the left!

464 Ms. Thompson invites the partners whose images are being questioned to respond. In  
465 two cases, students ask if they can measure side lengths to assure that they are all  
466 different. Ms. Thompson allows the class to reach consensus independently, agreeing  
467 that all four examples are right triangles with three sides of different lengths.

468 Ms. Thompson presents Task 2: "Make a triangle with exactly two congruent angles."

469 The procedures from the first task are duplicated here: read aloud, pause to think, then  
470 collaborate with a partner—but this time the second partner is the lead illustrator.

471 Ms. Thompson circulates, stopping beside her Emerging English learner student and  
472 partner to listen. To provide support for but not single out her English learner student,  
473 she asks the pair to draw or use hands to demonstrate what is meant by "congruent"  
474 angles. A brief exchange assures her that the partners are working effectively; she  
475 reminds the pair to rehearse how they could defend their illustration to their table  
476 partners and the class. Several student pairs are discussing congruence as she moves  
477 through the groups; some referring to their journals or the word wall listing mathematics  
478 terms. In quick check-ins with the remaining groups comprised of English learner  
479 students, Ms. Thompson notes that two of the Bridging students are letting their partners  
480 do most of the talking; she reminds students of the classroom norms for related to "equal  
481 voices," then engages with each pair in ways that engage the quieter students. After

482 instilling this balance, she encourages each, noting that partner time is a time for safe  
483 practice. Before leaving each group, she reminds the students that what she is heard is  
484 worth sharing when the time comes to discuss with the class, inviting her English learner  
485 students to reiterate for their peers what they developed in pairs.

486 When Ms. Thompson posts several students' illustrations, she includes an example with  
487 three congruent angles, not "exactly" two; as the task specified. This non-example  
488 promotes energetic discussion and respectful challenges from friendly skeptics.

489 The class continues with two more tasks:

- 490 ● Task 3: "Make a four-sided polygon with no parallel sides"
- 491 ● Task 4: "Make a four-sided polygon with one right angle and all sides different  
492 lengths"

493 As Ms. Thompson circulates, encourages, and listens intently, she acquires insights into  
494 students' understandings and strengths, and uncovers a few misconceptions. She notes  
495 with satisfaction that students are actively using mathematical practices, in particular,  
496 SMPs 3 and 6. These observations guide her as she orchestrates the skeptics'  
497 discussion for each task.

498 Ms. Thompson will use students' responses to the final task, an exit ticket, as a formative  
499 assessment. She has designed two exit tickets so that each student can express and  
500 share their own understanding independently rather than with support from their partner.

501 She tells the class, rather than repeating the "Convince Yourself, a Friend, a Skeptic"  
502 routine, they will respond independently. Each student may choose to respond using  
503 paper and pencil, or the Whiteboard. Those who respond digitally share their work via  
504 the link sharing button and post it into their Google Classroom assignment. The paper  
505 copies are collected.

506 The exit ticket tasks involve concepts of parallel sides and angle measurement, which  
507 are key understandings in the grade four standards (4.MD.5, 6; 4.G.1,2).

508 Task 5:

- 509 a) Make a four-sided polygon with no right angles but with opposite sides parallel
- 510 b) Make a four-sided polygon with at least two angles greater than  $90^\circ$

511 As she reflects on the lesson, Ms. Thompson notes:

- 512 ● Whiteboard’s immediacy expedited the students’ creation, and the teacher’s
- 513 selection and presentation, of work samples
- 514 ● images were large, detailed, and easily viewed by all students
- 515 ● with few exceptions, students were engaged throughout the lesson
- 516 ● all students were able to use the technology to make their own polygons
- 517 ● partners shared the use of the device smoothly
- 518 ● the level of challenge was appropriate for almost all students
- 519 ● three of the seven English learners who are at the Bridging stage were willing to
- 520 speak with their individual partners, but remained quiet in table and whole-class
- 521 discussions
- 522 ● two of the four English learners at the Expanding level justified their reasoning
- 523 confidently during the whole-class discussion.

524 During the next lesson, Ms. Thompson will create an opportunity for students to correct  
525 any misunderstandings that were revealed, as well as solidify their learning by sharing  
526 and analyzing examples of Task 5 illustrations.

527 [Note: The following sections, aside from the Desmos vignette, were primarily taken from  
528 the CA Digital Learning Integration and Standards Guidance and the California  
529 Department of Education’s Distance Learning website.]

## 530 **Digital Learning**

531 Digital learning presents a unique set of challenges and opportunities for students,  
532 parents, teachers, and schools. Technology plays a vital role in facilitating meaningful  
533 learning of mathematics within a digital learning format. It is important to develop  
534 structures that continue to place students at the center of learning, while also being  
535 mindful of the varied contexts of at-home supports.

536 To support schools in the effective implementation of technology to support learning, the  
537 *California Digital Learning Integration and Standards Guidance* (CDE, 2021) provides  
538 strategies to build educator and system capacity. The guide is based on foundational,  
539 research-based digital learning practices, including engaging in personal interaction,  
540 building classroom communities, promoting collaboration, incorporating authentic

541 assessment, designing active learning activities, and cultivating student-centered  
542 opportunities to build agency.

543 The guide is organized into three sections, Sections A, B, and C. Section A presents six  
544 distinct areas of need. Addressing each area of need is essential to ensuring digital  
545 learning opportunities are effective and equitable. Sections B and C of the guide provide  
546 standards guidance for mathematics and English language arts/English language  
547 development by identifying and addressing critical areas of instructional focus.

548 ● Section A

549 ○ Chapter 1

550 ■ Ensuring Equity and Access

551 ■ Preparing and Supporting Teachers for Digital Teaching

552 ■ Designing Meaningful Online and Blended Learning Experiences

553 ○ Chapter 2

554 ■ Assessing Students in Authentic Ways

555 ○ Chapter 3

556 ■ Infusing Social and Emotional Learning

557 ■ Cultivating Educator and Student Well-being

558 ● Section B

559 ○ Chapters 4-9

560 ■ Standards Guidance for Mathematics

561 ● Section C

562 ○ Chapters 10-16

563 ■ Standards Guidance for English Language Arts, Literacy, and  
564 English Language Development

565 This guide incorporates vignettes and interviews featuring California educators  
566 throughout the chapters. These vignettes and interviews provide examples of topic-  
567 specific, recommended strategies and resources for educators as they teach within and  
568 design digital learning environments.

569 Of particular relevance to this framework are Chapters 1–9. The following provides a  
570 summary of the key concepts presented in these chapters.

571 **Chapter 1** explores how to best ensure equity and access for all students, especially  
572 those who are affected by structural and institutional injustices during health and  
573 economic crises (PACE, 2020), including students with disabilities, students who are  
574 English learners, foster youth, and students experiencing homelessness (Repetto,  
575 Spitler, and Cox, 2018). Chapter 1 also includes a subsection on Preparing and  
576 Supporting Teachers for Digital Teaching, as pedagogical approaches and strategies for  
577 online and hybrid environments are vastly different than those used in a traditional  
578 setting (Archambault and Kennedy, 2018). Therefore, effectively incorporating  
579 technology into learning experiences requires strategic professional learning (Kolb and  
580 Carter, 2020) that is ongoing, practice-based, culturally relevant, content-specific, and  
581 context-specific. Designing Meaningful Online and Blended Learning Experiences is the  
582 final topic addressed in Chapter 1. This area provides practical guidance for educators  
583 who are designing online and hybrid learning experiences, including key considerations  
584 for aggregating time for synchronous and asynchronous learning.

585 **Chapter 2** focuses on the importance of assessments in a digital environment.  
586 Specifically, the chapter focuses on suggestions for implementing formative, summative,  
587 interim, and diagnostic assessments in online and blended learning environments. These  
588 assessments are essential in order to determine effectiveness of pedagogical strategies,  
589 understand individual students' needs and supports, and inform and individualize  
590 instruction to accelerate learning.

591 **Chapter 3** focuses on fostering healthy, equitable, and inclusive digital communities,  
592 including Infusing Social and Emotional Learning (SEL) and Cultivating Educator and  
593 Student Well-being. By emphasizing SEL and well-being, schools can create virtual  
594 learning environments that are safe and inclusive that support equitable student  
595 outcomes.

596 **Chapters 4 through 9** provide standards guidance for mathematics by addressing  
597 critical areas of instructional focus. The standards guidance is intended to support  
598 teachers as they implement mathematics instruction in online, blended, or in-person

599 learning environments. The standards guidance is organized around the “big ideas”  
600 proposed in the *Mathematics Framework*, which seeks to support teachers in moving to  
601 the teaching of meaningful mathematics and enabling students to develop an  
602 interconnected understanding of different concepts. Chapter 4 outlines additional  
603 suggestions for digital learning practices relevant to this content area, while Chapter 5  
604 provides an introduction to the standards guidance and highlights the importance of the  
605 content and the ways it is connected to other content and practices. Chapters 6 through  
606 9 organize guidance for standards by grade level.

607 This section is adapted from the guidance in planning, implementation and evaluation of  
608 online instruction from the California Department of Education (CDE) Distance Learning  
609 web page (CDE, n.d.b).

610 While nothing will replace the invaluable connection developed through in-person  
611 teaching, there are best practices local education agencies (LEAs) may consider in order  
612 to maximize instructional time. It is important to consider utilizing the time educators  
613 spend directly interacting with students to be focused, planned, and designed to further  
614 student learning goals. Learners will need opportunities for guided learning with an  
615 educator, as well as opportunities to work with peers, families, and community members  
616 to apply their learning and practice their skills. This guidance is not all-encompassing as  
617 instructional time can be a nuanced area. These suggestions are recommended best  
618 practices and do not constitute legal advice or a legal service.

## 619 **Common Definitions**

620 The definitions below are designed to provide a common understanding of the various  
621 models of learning and their unique distinctions and to avoid the common error of  
622 applying terms interchangeably. It is important to note that not all distance learning  
623 requirements outlined in the statute are included in this document. Readers should  
624 consider the CDE’s Frequently Asked Questions (CDE, n.d.c) and additional guidance  
625 documents as they plan for and engage in distance learning to ensure all requirements  
626 are met.

627 **Distance Learning.** Instruction in which the pupil and instructor are in different locations  
628 and pupils are under the general supervision of a certificated employee of the local

629 educational agency. Distance learning may include but is not limited to all of the  
630 following:

- 631 • Interaction, instruction, and check-in between teachers and pupils through the use  
632 of a computer or communications technology
- 633 • Video or audio instruction in which the primary mode of communication between  
634 the pupil and certificated employee is online interaction, instructional television,  
635 video, telecourses, or other instruction that relies on computer or communications  
636 technology
- 637 • The use of print materials incorporating assignments that are the subject of written  
638 or oral feedback (*Education Code [EC] 43500[a]*)

639 **Blended Learning.** Combination of in-person and distance instruction.

640 The below terms are used throughout the document to discuss ways in which LEAs offer  
641 high-quality distance learning in accordance with *EC* Section 43503.

642 **In-Person Instruction.** Instruction under the immediate physical supervision and control  
643 of a certificated employee of the local educational agency while engaged in educational  
644 activities required of the pupil.

645 **Synchronous Learning.** Synchronous learning takes place in real time, with delivery of  
646 instruction and/or interaction with participants such as a live whole-class, small group, or  
647 individual meeting via an online platform or in-person when possible.

648 **Asynchronous Learning.** Asynchronous learning occurs without direct, simultaneous  
649 interaction of participants such as videos featuring direct instruction of new content  
650 students watch on their own time.

651 **Time Value.** Instructional time for distance learning is calculated based on the time value  
652 of synchronous and/or asynchronous assignments made by and certified by a  
653 certificated employee of the LEA. Time value for distance learning is different than time  
654 value used previously in independent study programs which include an evaluation of the  
655 time value of work product.

656 Distance Learning assignments can include assigned instruction or activities delivered  
657 through synchronous or asynchronous means. Synchronous opportunities may include  
658 full group instruction, peer interaction, and collaboration, two-way communication, small  
659 group breakouts, or individual office hours. The delivery method should match the  
660 purpose of the current learning outcome, corresponding task, and program placement  
661 (i.e., Language Acquisition Program). At times it may be appropriate for new content to  
662 be delivered asynchronously utilizing synchronous time for peer interaction, small group  
663 breakouts, or individual office hours. Inversely, at times content may require  
664 synchronous opportunities to include direct instruction on new content. All modes should  
665 provide students a means of checking for understanding and progressing based on that  
666 understanding. For linguistically and culturally diverse English learners, this means of  
667 checking for understanding should include opportunities to have oral conversations to  
668 elaborate on the language necessary to articulate what is understood and ask questions  
669 for clarifying what is not fully comprehended. For students with disabilities, instructional  
670 time may be determined by the IEP team, as instructional delivery should be  
671 appropriately adapted to the unique needs of the student. Additionally, instruction and  
672 activities should be aligned to learning objectives and goals specified in the IEP.

673 There is an opportunity for staff to develop integrated lessons to maximize instructional  
674 time. An example might include integrating science and math standards in a  
675 performance task. Educators will need to support the development of independent  
676 learning skills through modeling, scaffolding, student conferences, feedback, and  
677 reflection. Although family support is important, applied learning experiences should take  
678 into account that many families will not be able to provide extensive support. During time  
679 allotted for applied learning, it is important for an adult to be available for questions.  
680 Educators will need to be especially in tune with language needs and provide sufficient  
681 language scaffolds to ensure the student can participate fully in the development of  
682 content and the development of the necessary linguistic structures to meet the language  
683 demands of the lesson. Integrated English language development (ELD) is critical for  
684 English learners' access to the material and should be an integral part of the lesson  
685 planning and delivery process in all subjects. Structures may need to be in place to  
686 provide support for students that may not have an English-speaking adult or family  
687 member to support applied learning. Consider using expanded learning staff or other

688 staff from community-based organizations to support individual students or learning pods  
689 of students. Collaboration with families can be especially important when developing  
690 learning opportunities for students with disabilities, particularly students with extensive  
691 support needs. Gauging the needs of the family in supporting the student will be key to  
692 ensuring successful student outcomes. LEAs are encouraged to engage service  
693 providers and paraprofessionals in collaboratively supporting the students and family to  
694 ensure meaningful access to learning opportunities.

695 The ratio of synchronous and asynchronous and the sequence of these chunks of  
696 instructional time will depend on the course structure, instructional methods, access to  
697 technology tools, student needs, and whether learning is taking place entirely online or if  
698 the class is using a blended model. As such, it is important to emphasize that these two  
699 types of instructional time do not need to be chunked or sequenced in any particular  
700 way. For example, a teacher may choose to have students spend an estimated 30  
701 minutes independently reading a text to prepare for a 20-minute, teacher-facilitated,  
702 synchronous discussion, followed by a 30-minute group research task, and then another  
703 10-minute check-in discussion. Some English learners may need materials in the primary  
704 language to support their independent learning. Parents may need guidance as to how  
705 to support their child to enhance and support the student using these materials.

706 In the context of a multilingual program, instructional minutes in each language should  
707 be aligned to the percentage of minutes dedicated to that language based on the  
708 program design. For example, if 80 percent of the instructional minutes in a dual-  
709 language immersion program are dedicated to Spanish, then 80 percent of the 230  
710 instructional minutes in a third-grade classroom should be dedicated to Spanish  
711 instruction and interaction.

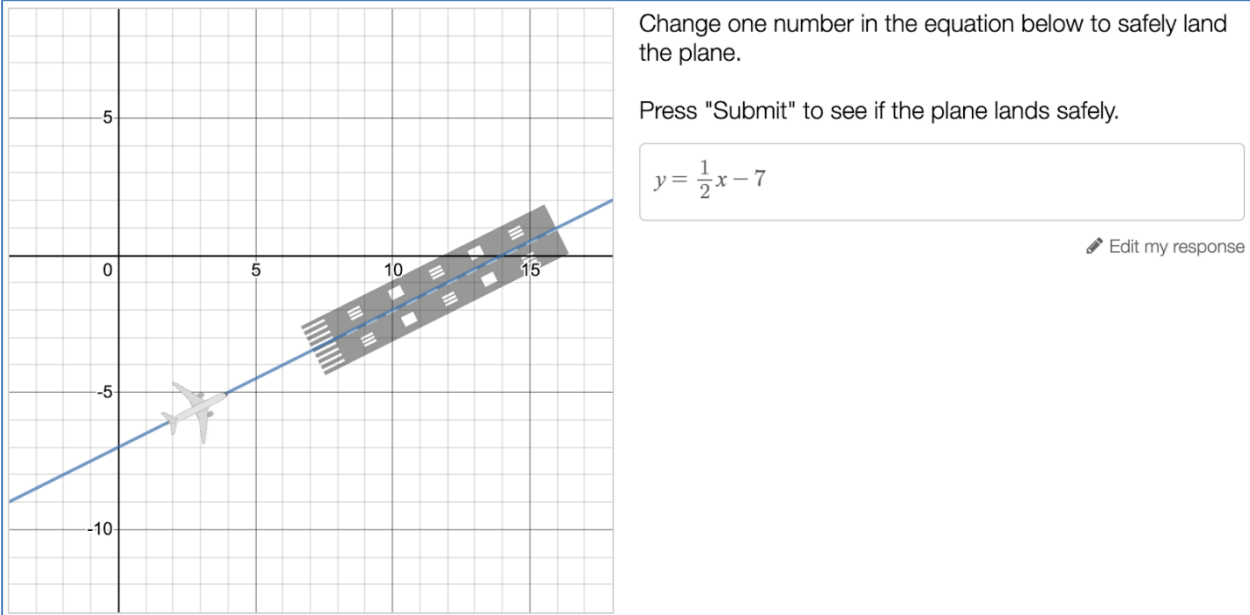

### 712 ***Snapshot: Landing the Plane (Grade Eight)***

713 This snapshot illustrates a use of technology to provide access for all students to sense-  
714 making mathematics, in remote or in-person settings.

715 During distance learning, Ms. Trejo and her grade-eight students have less than half the  
716 synchronous learning time they had last year. She is planning strategically, trying to  
717 understand how best to use the time they are together and the time they are apart. She

718 also values math that is conceptual and math that is learned through social interactions  
719 between students. The physical distance due to schools moving to online teaching and  
720 learning, and the tendency of computer-based mathematics to isolate students behind a  
721 monitor, puts both of those goals at risk. Ms. Trejo decides that a Desmos activity called  
722 *Land the Plane*, should work as well in her current remote-instruction setting as it has in  
723 her in-person past instruction.

724 Using her classroom learning management system, she invites students to work  
725 asynchronously to “Land the Plane” (n.d.). The activity asks students to plot the linear  
726 equation of a plane so that it lands on a runway. Students can work on much of the  
727 activity by themselves because the activity gives them *interpretive* rather than *evaluative*  
728 feedback. Instead of seeing “right” or “wrong” as their feedback, students see the plane  
729 travel along the graph of whatever linear equation they plot. They learn from that  
730 feedback and try again.

Change one number in the equation below to safely land the plane.

Press "Submit" to see if the plane lands safely.

$$y = \frac{1}{2}x - 7$$

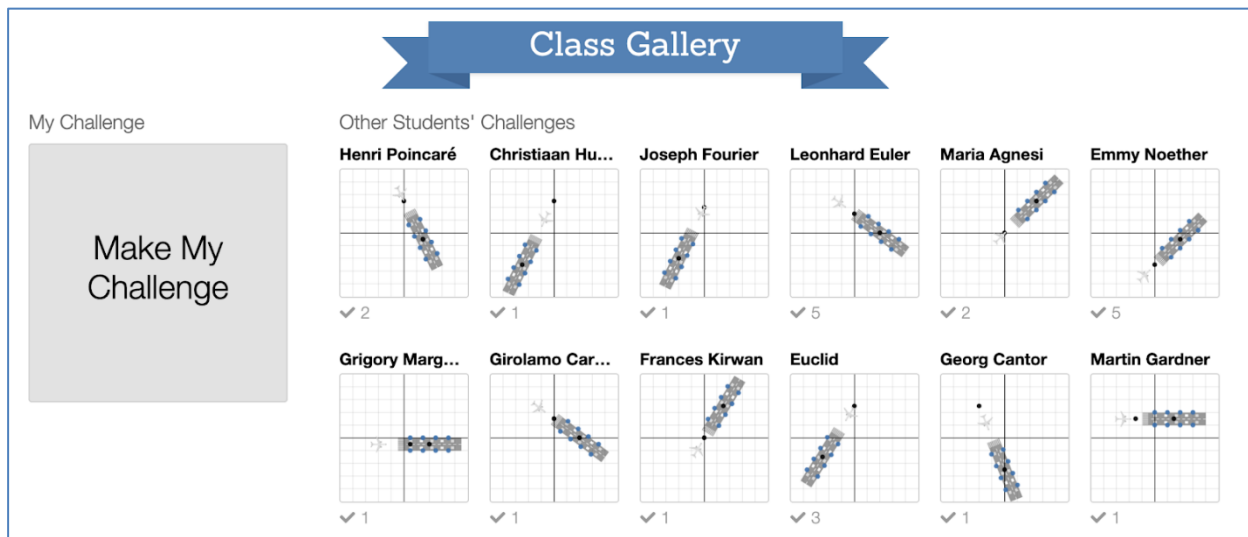

[Edit my response](#)

731  
732 [Link to long description](#)

733 During their limited synchronous time, Ms. Trejo focuses her and her class’s energy on  
734 some questions that computers *cannot* interpret or evaluate. In one case, students are  
735 presented with two hypothetical students’ linear equations and are asked to argue in  
736 favor of one. Ms. Trejo uses the Desmos Snapshot tool to select and (anonymously)

737 present unique student answers, and then invites students to discuss the strengths and  
738 weaknesses of those answers.

739 During this synchronous time, she also asks students to participate in the “Challenge  
740 Creator,” an activity where students create runway challenges for their classmates to  
741 solve.

742  
743 [Link to long description](#)  
744 Based on her understanding of her students, she uses this activity to encourage  
745 discussion and debate among students over each other's challenges—and, sure  
746 enough, students debate in the chat which challenges were too easy, which seemed  
747 impossible, and how many tries they needed to solve the hardest ones, all while learning  
748 that they themselves can be authors of rich math questions, not just teachers and  
749 textbooks.

750 Distance learning has put many of Ms. Trejo's pedagogical and mathematical goals at  
751 risk, but she has found digital tools that enhance, rather than undermine, her students'  
752 mathematical connections and creativity.

### 753 **Research-Based Distance Learning Principles**

754 Research on effective distance and blended instruction can provide helpful principles for  
755 educators. It is useful to know that well-designed online or blended instruction can be as  
756 or more effective than in-classroom learning alone. While many worry that distance  
757 learning is necessarily less effective than in-person learning, many studies show that

758 well-designed distance learning that has the features described below is often more  
759 effective than traditional in-classroom learning alone (US Department of Education,  
760 2010; see also Policy Analysis for California Education, 2020). Key elements include:

761 1. A strategic combination of synchronous and asynchronous instruction: Combining  
762 synchronous activities where students meet regularly online (or in-person) with  
763 their classmates and teachers, with asynchronous activities where students think  
764 deeply and engage with the subject matter and other students independently are  
765 more effective than fully synchronous online courses.

766 Synchronous time should be set for reasonable amounts of time, punctuated with  
767 other activities to avoid attention fatigue. It can be used for short mini-lectures and  
768 for many kinds of student to student and student to teacher interaction as  
769 described below. Many students also benefit from synchronous individual or  
770 small-group support in addition to whole-group distance instruction.

771 Asynchronous time can provide an opportunity for students to gain exposure to  
772 concepts prior to engaging in synchronous time or as a follow up to dive more  
773 deeply into concepts that have been introduced through independent activities  
774 such as reading articles, watching videos or software-based presentations with  
775 voiceover, or completing modules online. Teachers can also use these  
776 asynchronous modules to provide targeted scaffolding or essential background  
777 information for those students in need of extra support in a particular area.

778 2. Student control over how they engage with asynchronous instruction: Research  
779 shows that students do better when they can go at their own pace, on their own  
780 time, when they have some choice over the learning materials to use and the  
781 learning strategies that work best for them, and when materials are set-up to  
782 enable them to engage deeply and critically with course content by managing how  
783 they use videos or print materials. As one successful online teacher explains:

784 Rather than assigning only worksheets or reading questions that can often  
785 lead to frustration and disengagement, offer students approaches that are  
786 universally designed so they can build and apply knowledge based on their  
787 interests and readiness levels. For example, provide a recorded lecture,

788 two or three videos, and two readings about the topic. The students can  
789 listen or watch the lecture and then choose to complete a combination of  
790 the remaining content options. Provide links to reading assignments at  
791 different reading levels so that all students find a path to comprehension,  
792 with tools like Newsela, Rewordify, News in Levels, and more. Give two or  
793 three choices for completing a task, such as writing, recording a video,  
794 building a slide deck, using a game-based education platform to  
795 demonstrate math concepts, or historical and literary events, through  
796 building. Allow students to upload their work onto the classroom learning  
797 platform to share with peers. (For more information on Universal Design for  
798 Learning see Chapter 2)

799 3. Frequent, direct, and meaningful interaction. The more interaction students have  
800 with other students, with their teachers, and with interactive content, the stronger  
801 the learning gains. In online learning environments where there is little student-  
802 student, student-instructor, and student-content interaction, students often  
803 become disengaged. Activities such as experiments, debates, data analysis, and  
804 groups solving challenging applications together can serve to synthesize and  
805 extend student knowledge. Students can interact with peers and the teacher in  
806 multiple formats—whole group and small group discussion in synchronous  
807 instruction (for example in Zoom breakout rooms), chat rooms and discussion  
808 boards that may be synchronous or asynchronous, quick polls and votes followed  
809 by debate and discussion are all means to improve engagement, and create  
810 positive effects on learning gains, as do interactive materials.

811 4. Collaborative learning opportunities. Opportunities for students to engage in  
812 interdependent cooperative learning are important and improve achievement.  
813 Teachers can structure learning opportunities that encourage collaboration by  
814 accommodating flexible grouping options for completing work and by setting class  
815 norms for collaborative activities. This includes group engagement in shared  
816 projects and presentations as well as smaller daily activities. Small groups can  
817 work on tasks together during synchronous time in breakout rooms and then  
818 return to share their ideas. Asynchronous tasks can also be structured to offer

819 opportunities for students to collaborate and build learning together, for example  
820 through discussion boards and by providing peer feedback. Students can pursue  
821 projects in asynchronous time by being taught to set up their own collaboration in  
822 on-line platforms.

823 5. Interactive materials. High-quality distance learning incorporates the use of  
824 interactive multimedia materials, typically during asynchronous learning. For  
825 example, researchers found that eighth-grade students whose teachers integrated  
826 the use of the Pathways to Freedom Electronic Field Trips—an online collection of  
827 interactive activities designed by Maryland Public Television—in their teaching  
828 about slavery and the Underground Railroad, outperformed those who had the  
829 same unit without these materials. Fifth-grade science students who used a virtual  
830 web-based science lab, allowing them to conduct virtual experiments while  
831 teachers observed student work and gave feedback online, outperformed those  
832 who did an in-person science lab. Elementary special education students across  
833 five urban schools who used a web-based program supporting writing in action by  
834 prompting attention to the topical organization and structure of ideas during the  
835 planning and composing phases of writing outperformed those who had the same  
836 materials in hardcopy in the classroom (US Department of Education, 2010).

837 6. Assessment through formative feedback, reflection, and revision. Formative  
838 assessment is very important in online and blended learning, and it promotes  
839 stronger learning when it provides feedback that allows students to reflect on and  
840 revise their work. For example, researchers found that students performed better  
841 when they used a formative online self-assessment strategy that gave them  
842 resources to explore when they answered an item incorrectly. Similarly, students  
843 who received quizzes that allowed them the opportunity for additional practice on  
844 item types that had been answered incorrectly did better over time than those who  
845 received quizzes identifying only right and wrong answers. Studies have found  
846 positive effects of a variety of reflection tools during on-line learning, ranging from  
847 questions asking students to reflect on their problem-solving activities to prompts  
848 for students to provide explanations regarding their work, student reflection  
849 exercises during and after online learning activities, and learning guidance

850 systems which ask questions as students design studies or conduct other  
851 activities that support students' thinking processes without offering direct answers  
852 (US Department of Education, 2010).

853 7. Explicit teaching of self-management strategies. Students who receive instruction  
854 in self-regulation learning strategies perform better in online learning. Teachers  
855 can help students with tools that help them schedule their time, set goals, and  
856 evaluate their own work. They can also provide checklists that are readily  
857 available to students and parents that break out the steps for task completion to  
858 help them understand the scope of the work and the milestones they'll accomplish  
859 along the way.

## 860 **Ensuring Support for Distance Learning**

861 As districts prepare for the start or restart of a distance learning program, it is important  
862 they consider: ways to engage and support families and staff, the utilization of common  
863 tools, and the identification of success criteria. For students with disabilities, LEAs should  
864 plan for how IEPs can be executed in a distance learning environment. It is also  
865 important to establish the ELD program expectations, schedules, and guidance as to  
866 how to make sure both designated and integrated ELD is provided consistently  
867 throughout all subjects.

## 868 **Preparing Families and Staff for Distance Learning**

869 In order to ensure parents and staff (including community partners where applicable) feel  
870 comfortable and prepared to engage in distance learning, it is important to solicit  
871 feedback, understanding their experience in distance learning, if any, as well as offering  
872 multiple opportunities to discuss expectations and engage with technology in a low-  
873 stakes setting. It is important to engage with parents in the language which is spoken in  
874 the home.

Focus	Considerations
Understanding context	<ul style="list-style-type: none"> <li>● Students Perspectives on Distance Learning [Survey (in multiple languages) or focus groups] <ul style="list-style-type: none"> <li>○ What did you like best about distance learning?</li> <li>○ What part of distance learning was the most challenging?</li> <li>○ If you could do one thing to improve Distance Learning what would it be?</li> </ul> </li> <li>● Teacher Perspectives (Survey or focus groups) <ul style="list-style-type: none"> <li>○ What worked well in distance learning over the spring?</li> <li>○ What were some of the biggest challenges?</li> <li>○ What do you need to be successful in distance learning in the fall?</li> <li>○ Were you able to support various types of student needs including culturally and linguistically diverse English learners, students with disabilities, foster youth, socioeconomically disadvantaged youth, etc.?</li> <li>○ What strategies did you use to provide integrated and designated English language development (ELD)? Where do you need additional assistance?</li> </ul> </li> <li>● Parents (Survey or focus group with appropriate translations) <ul style="list-style-type: none"> <li>○ What worked well with distance learning?</li> <li>○ What was the most difficult?</li> <li>○ How would you improve distance learning to better support your child?</li> <li>○ What support would you like/need as Distance Learning continues?</li> <li>○ Was the information provided in a language and manner accessible to you and your family?</li> </ul> </li> </ul>

Focus	Considerations
During the initial opening/reopening	<ul style="list-style-type: none"> <li>● Considerations for Staff <ul style="list-style-type: none"> <li>○ Offer professional development on a common digital platform by site (See Common Tools Below).</li> <li>○ Support a common use of platforms. Example: If using google classroom, are all teachers logging homework in the same place?</li> <li>○ Ensure all staff are informed of students with disabilities (SWDs) current IEP and 504 accommodations and if concerned who to contact to discuss supports needed in Distance Learning</li> <li>○ Provide professional learning on integrated and designated ELD in the distance learning context and ensure that all staff are aware of the requirement that both integrated and designated ELD are provided to English learners.</li> <li>○ Provide professional learning on dual language instruction in the distance learning context and ensure that all staff are aware of the instructional minute requirements and plan for language use schedules to ensure language models continue as designed.</li> <li>○ Plan for a schedule of agreed-upon times of IEP meetings to ensure all team members are available to be present.</li> <li>○ Collaborate with the IEP team to schedule services for students within the agreed-upon instructional minutes schedule.</li> </ul> </li>   <li>● Considerations for Parents/Students <ul style="list-style-type: none"> <li>○ Over the course of a week consider offering opportunities for 1:1 meetings or meetings in groups with parents and students. It may be helpful to offer evening options for parents that work full-time. Ensure that interpreters are available for parents who speak languages other than English to the extent possible.</li> <li>○ Review the digital platform with the student and parent.</li> <li>○ In transitioning to online learning, it is recommended that schools survey parental expertise with technology to better strategize support for their family as needed.</li> <li>○ Discuss the rhythm of learning that will be established: Where and/when is work posted? How do they submit assignments?</li> </ul> </li>   <li>● Ask parents about the best form of communication and feedback loop.</li> </ul>

Focus	Considerations
On-going	<ul style="list-style-type: none"> <li>● Considerations for Staff <ul style="list-style-type: none"> <li>○ Offer tiered (ranging from beginning to mastering) professional development opportunities for staff to continue to build their capacity in areas to support distance learning such as learning platforms, engaging strategies, or tools and resources.</li> <li>○ Utilize staff meeting time to review success criteria (page 34), address emerging needs, celebrate successes and identify areas for ongoing professional development.</li> <li>○ Establish a regular time for grade-level teams to collaborate in developing shared resources, review student work, and co-create lessons.</li> <li>○ Provide ongoing professional learning on integrated and designated ELD in the distance learning context and time for teachers to collaborate on addressing the needs of English learners (successes and next steps).</li> <li>○ Provide regular time for grade-level teams to collaborate with special education teams (SAI; SLP; OT; APE) to discuss supports/challenges in DL model and GE curriculum</li> </ul> </li> <li>● Considerations for Parents/Students <ul style="list-style-type: none"> <li>○ Establish a regular time for parents to receive support with technology as needed. Explore platforms that are available in languages other than English to ensure that parents and students have access and that the home language is seen as an asset.</li> <li>○ Establish regular office hours for students to connect with their teachers and peers.</li> <li>○ Ensure that communications with parents are translated to the extent possible and that translators are available for teachers to contact parents who speak languages other than English.</li> </ul> </li> </ul>

875 **Tips for Success**

- 876 ● Consider means of communication other than email, such as text messages,  
877 phone calls or school-wide communication systems. Survey data that shows one  
878 in three families of English learners do not have an email address.
- 879 ● Google and several text messaging apps provide alternative phone numbers that  
880 link to your personal phone number so that it is kept private. Calling the alternative

881 phone number will connect to you directly. These services are typically free of  
882 charge. Several text messaging apps provide translation services for two-way  
883 translation (from English to the parent’s preferred language and also translating  
884 their response back to English).

- 885 • Consider creating videos regarding how to access the digital platform for future  
886 viewing.
- 887 • Consider providing guidance in multiple languages including video, written  
888 material, digital material, and technology platforms, apps, and others.

## 889 Use of Common Tools

890 Consistency across grade-levels will support the success of students and families as  
891 they prepare to engage in distance learning. Consistency also provides opportunities for  
892 teachers to marshal resources. As an example, if teachers are all using the same high-  
893 quality curriculum, they might develop or curate videos for asynchronous learning and  
894 share with colleagues. Consistent use of platforms allows parents with multiple children  
895 to learn and offer support in a focused area. Similarly, students with multiple teachers will  
896 have space to focus on content as opposed to navigating multiple digital platforms for  
897 learning.

Focus	Considerations
Common district-wide digital (learning management system) platform	<ul style="list-style-type: none"><li>• Select one common digital platform for appropriate grade-spans, i.e., kindergarten and first grade may utilize a different platform than second-grade and above.</li><li>• Ensure support is provided to teachers on how to use the platform in a consistent manner.</li><li>• Ensure support is provided to parents on how to use the system and that this support is available in multiple languages.</li></ul>

Focus	Considerations
Use of common high-quality instructional materials and resources	<ul style="list-style-type: none"> <li>● Identify the district adopted materials for each subject area.</li> <li>● Ensure every teacher has access to the required curriculum, including ELD and Special Education.</li> <li>● As a staff, use the categories of investigation identified in this Framework (see chapters six, seven, and eight) for focus and planning in distance learning.</li> <li>● As a staff, use the CA CCSSM to identify the new content introduced in each grade-level for focus and planning.</li> <li>● As a staff, use the <i>ELA/ELD Framework</i> and the ELD standards to ensure that instructional materials include both integrated and designated ELD for English learners. Integrated ELD should be provided in all subject areas.</li> <li>● As a staff, discuss multilingual program needs.</li> <li>● Identify necessary supports to build staff, parent, and student capacity around the curriculum that will be used. (see Preparing Families and Staff for Distance Learning above)</li> </ul>
Use of common diagnostic, formative, and summative assessments	<ul style="list-style-type: none"> <li>● Administer a common grade-appropriate diagnostic assessment at the beginning of the year to establish a baseline for student learning</li> <li>● Plan for the administration of common assessments to use for grade-level collaboration, including assessments in other languages for multilingual programs and the English language proficiency for ELD progress.</li> <li>● Provide timely, personalized feedback to students on formative and summative assessments including acknowledgment of the receipt of their work and a way for students to track their grades.</li> <li>● Communicate to parents and students progress in learning regularly ensuring translations when appropriate.</li> </ul>

898 **Success Criteria**

899 It is important for districts to review the past and current local data in order to identify  
900 metrics for success in the distance learning setting. As an example, if an LEA previously  
901 saw high rates of chronic absenteeism with their students with disabilities, a clear  
902 improvement outcome should be established with a plan to monitor participation rates for

903 that student group. Improvement outcomes should include resources and supports to  
 904 enhance connectivity, technology, and digital literacy for both students and families.  
 905 Success criteria will clearly communicate the vision of the LEA regarding student  
 906 performance and allow staff to monitor progress, to celebrate success, and identify  
 907 needs early.

Focus	Considerations
Identify metrics to monitor progress in DL over time	<ul style="list-style-type: none"> <li>● Identify anticipated student needs based on previous data and on formative assessments within the first month of school.</li> <li>● Develop clear, consistent ways to solicit feedback from students, parents, and staff in their home language and in a method accessible to them.</li> <li>● Identify and develop common assessments at each grade level.</li> <li>● Identify local data to review regularly, including specific data for student subgroups traditionally underserved.</li> <li>● Schools should consider external factors as they impact learning, such as power outages, evacuations, etc.</li> </ul>
Data Commitments	<ul style="list-style-type: none"> <li>● Develop clear data commitments: when will assessments be given? Who will collect the information? Who will create data visuals that are easy to read?</li> <li>● How are schools monitoring students' progress and participation?</li> <li>● What data needs to be collected to assess whether all learners are utilizing available resources?</li> </ul>
Data Analysis	<ul style="list-style-type: none"> <li>● Review data on a regular basis with the Every Ed Team (comprised of representative staff to support general education including students with disabilities and English learners)</li> <li>● Communicate data at staff meetings including time to brainstorm the next steps.</li> <li>● Establish a relationship between data outcomes and practices or strategies that were implemented.</li> </ul>

908 Distance Learning Curriculum and Instructional Guidance for Mathematics

## 909 **Conclusion**

910 Many technologies have the potential to support rich and deep mathematical learning for  
911 all students. Some provide contexts and representations of mathematical ideas (and  
912 tools for interacting with them) that help students deepen their understanding and their  
913 practice of mathematics. Others are not discipline-specific but support student-centered  
914 pedagogy consistent with Chapter 2 of this framework. As new technologies emerge, it is  
915 crucial that mathematical learning goals drive their use, that the tools support all  
916 learners, and that implementation be supported with high-quality professional learning  
917 opportunities for educators.

## 918 **Long Descriptions for Chapter 11**

919 Figure 11.1: Technological Pedagogical Content Knowledge Model

920 A three circle Venn diagram. Technological Knowledge, Content Knowledge, and  
921 Pedagogical Knowledge overlap to create Pedagogical Content Knowledge,  
922 Technological Pedagogical Knowledge, Technological Content Knowledge, and  
923 Technological Pedagogical Content Knowledge, or TPACK. [Return to graphic.](#)

924 Land the Plane

925 Coordinate plane with a line indicated, with equation  $y = 1/2x - 7$ . The line crosses the y-  
926 axis at (0,-7) and x-axis at (14,0). There is an airplane runway drawn on the line,  
927 extending from roughly (7,-4) to (16,1). Text on the right includes instructions: change  
928 one number in the equation below to safely hold the plane. Press “Submit” to see if the  
929 plan lands safely. [Return to graphic.](#)

930 Class Gallery for Land the Plane

931 Desmos Snapshot tool titled Class Gallery, Make My Challenge. “Other students’  
932 challenges” are presented as twelve graphs containing proposed runways for aircraft at  
933 varying degrees. Graph 1: Henri Poincaré, includes a runway in quadrants I and IV.  
934 Graph 2: Christiaan Hu..., includes a runway in quadrant III. Graph 3: Joseph Fourier,  
935 includes a runway in quadrant II and III. Graph 4: Leonard Euler, includes a runway in  
936 quadrants I and IV. Graph 5: Maria Agnesi, includes a runway in quadrant I. Graph 6:

937 Emmy Noether, includes a runway in quadrants IV and I. Graph 7: Grigory Marg...  
938 includes a runway in quadrants III and IV. Graph 8: Girolamo Car..., includes a runway in  
939 quadrants I, II, and IV. Graph 9: Frances Kirwan, includes a runway in quadrant I. Graph  
940 10: Euclid, includes a runway in quadrants II and III. Graph 11: Georg Cantor, includes a  
941 runway in quadrants III and IV. Graph 12: Martin Gardner, includes a runway in  
942 quadrants I and II. [Return to graphic.](#)

California Department of Education, March 2022
