## 31 **Introduction**

32 Assessment is a critical step in the teaching and learning process for students,  
33 teachers, administrators, and parents, as a “systematic collection and analysis of  
34 information to improve student learning” (Stassen et al., 2001, 5). Student mathematics  
35 assessment is evolving from rote tests of skills to multi-dimensional measures of  
36 problem-solving capacity and evidence-based reasoning. This evolution is ongoing in  
37 California, as assessments continue to change in order to reflect shifting classroom,  
38 school, district, and state priorities. However, as increasingly modern assessments  
39 continue to replace traditional tests, all educational assessment should share a common  
40 purpose: collecting evidence to enhance student learning, supporting students’

41 development of positive mathematics identities (Aguirre, Mayfield-Ingram, and Martin,  
42 2013).

43 A comprehensive assessment system consists of summative, interim, and formative  
44 assessment. This chapter begins by addressing the need for rethinking the frequency of  
45 tests in classrooms that focus only on answer finding. The chapter will discuss the two  
46 primary forms of mathematics assessments: **formative assessment** (assessment *for*  
47 learning), and **summative assessment** (assessment *of* learning). Each of these will be  
48 discussed in detail and describe how they relate to mathematics instruction and  
49 learning, with several examples shown.

## 50 **Broadening Assessment Practices**

51 Important mathematics learning is multidimensional and can be demonstrated through  
52 many forms of communication, such as speaking, drawing, writing, and model building –  
53 integrating mathematical content and practices. It has long been the practice in  
54 mathematics classrooms to assess students' mathematics achievement through narrow  
55 tests of procedural knowledge. The knowledge needed for success on such tests is far  
56 from the adaptable, critical and analytical thinking needed by students in the modern  
57 world. The California Assessment of Student Performance and Progress (CAASPP) has  
58 been designed to assess students in responsive and multifaceted ways, capturing their  
59 reasoning and problem solving. More traditional forms of tests, that are usually  
60 decontextualized questions that require procedural knowledge, without any reasoning or  
61 problem solving, have been found to be of limited use in predicting success in college  
62 and the workplace. This has led leading employers, such as Google, to eliminate  
63 standardized tests from their application requirements (Bryant, 2013). Many colleges,  
64 including all of the University of California colleges, have now eliminated SAT tests from  
65 the admissions process.

66 Measurements of learning that are most helpful are those that assess students' breadth  
67 of knowledge and understanding of mathematical content and practices, and that  
68 require students to reason and problem solve. Recommendations for assessment  
69 equitable teaching and assessing, with clear links between the pursuit of equity and the

70 ways teachers assess students can be found in Feldman (2019) and DeSilva (2020).  
71 This chapter sets out an approach that includes the principle that assessment design  
72 elements should be inclusive of considerations for all students, including culturally and  
73 linguistically diverse learners and students in multilingual programs.

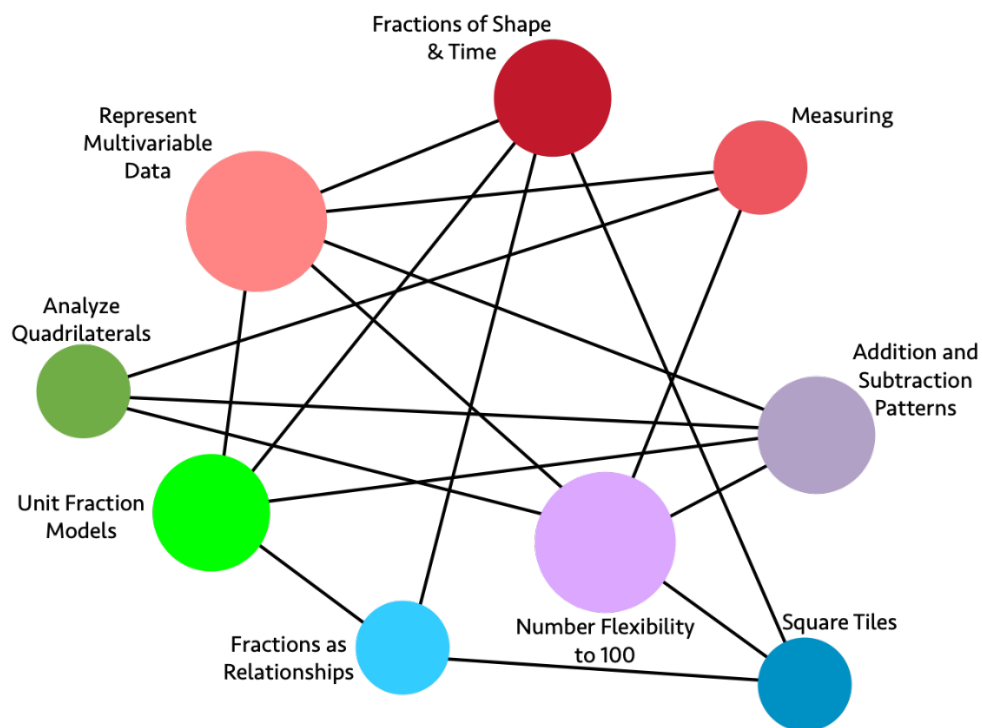

74 A particularly damaging assessment practice to avoid is the use of timed tests to assess  
75 speed of mathematical fact retention, as such tests have been found to prompt  
76 mathematics anxiety. When anxious, the working memory—the part of the brain needed  
77 for reproducing mathematics facts—is compromised. Math anxiety has now been  
78 recorded in students as young as five years old (Ramirez et al., 2013) and timed tests  
79 are a major cause of this debilitating, often life-long condition (Boaler, 2014). In recent  
80 years, brain researchers have found that the students who are most successful with  
81 number problems are those who are using different brain pathways—one that is  
82 numerical and symbolic and the other that involves more intuitive and spatial reasoning  
83 (Park and Brannon, 2013). Alternative activities can be used that develop mathematics  
84 fact fluency through engaging, conceptual, visual activities, instead of anxiety  
85 producing, speed tests. Inflexible, narrow methods of assessing mathematical  
86 competence also disadvantage students with learning differences. The framework of  
87 Universal Design for Learning (UDL) explicitly calls for multi-dimensional assessment  
88 practices (Meyer et al., 2014). In mathematics, assessments should be flexible, allowing  
89 for multiple means of expression, such as talking, writing words, drawing using  
90 manipulatives or typing responses, as well as provide actionable feedback to students  
91 (Lambert, 2020). They should also assess an integrated approach of mathematical  
92 content and practices. For multilingual learners, teachers can consider whether students  
93 can show their understanding in their own language. The Smarter Balanced CAASPP  
94 assessment is available in Spanish in a “stacked version” showing the questions in both  
95 languages (<https://www.caaspp.org/>).

96 Chapters 6, 7, and 8 set out an approach to mathematics teaching through big ideas  
97 that integrate mathematical content and practices, instead of narrow procedures, with  
98 many ideas for tasks that focus on big ideas throughout transitional kindergarten  
99 through grade twelve. Assessments should match the focus on big ideas, with students

100 receiving opportunities to share conceptual thinking, reasoning and work, that are  
101 assessed with rubrics, as set out in this chapter.

102 Figure 12.1 shows the big ideas for grade three followed by a rubric that focuses on the  
103 big ideas and mathematical practices.

104 Figure 12.1. Big Idea Network Map for Grade Three—see also appendix A for big ideas  
105 TK-10.

106

107 [Link to long description](#)

108 Sample Rubric for Grade Three Assessing Big Ideas and Mathematical Practices

109 This rubric gives an overview of the big ideas for grade three. It connects the Drivers of  
110 Investigation to both the big ideas and the standards for mathematical practice (SMP).

111 Periodically and throughout the school year, teachers can use a rubric like this to  
112 assess and give feedback to students around their strengths and areas for growth. The

113 teacher notes those indicators that the student has shown understanding, and which

114 ones the student should focus on to further student learning. The final two columns are  
 115 meant to be filled in by the teacher.

116 **Considerations for the final two columns to be completed by the teacher (TBT):**

117 **Student Strength:** What does the student understand in terms of this standard? What  
 118 linguistic and cultural assets possessed by the students can I tap into to support all  
 119 students, including those on the road to English proficiency, in their mastery of the  
 120 content?

121 **Student Area for Growth:** What should the student focus on to strengthen their  
 122 understanding of this standard?

Content Connections	Big ideas	Mathematical Practice Standards	Indicators: The student...	Student Strength	Student area for Growth
Communicating Stories with Data	Represent Multivariate Data	<b>SMP.1:</b> Make sense of problems and persevere in solving them. <b>SMP.4:</b> Model with mathematics <b>SMP.6:</b> Attend to precision	-Interprets appropriate meaning from graphs -Strategically organizes multivariable data -Creates graphs that clearly communicate information from data	TBT	TBT
Communicating Stories with Data	Fractions of Shape and Time	<b>SMP.4:</b> Model with mathematics <b>SMP.5:</b> Use appropriate tools strategically. <b>SMP.6:</b> Attend to precision	-Creates data visualizations that clearly capture and communicate about data collected over time	TBT	TBT
Exploring Changing Quantities	Addition and Subtraction problems	<b>SMP.3:</b> Construct viable arguments and critique the reasoning of others. <b>SMP.5:</b> Use appropriate tools strategically. <b>SMP.7:</b> Look for and make use of structure.	-Computes sums and differences within 1000 -Justifies solutions using appropriate tools or models -Constructs arguments with clear reasoning to support solutions	TBT	TBT

Content Connections	Big ideas	Mathematical Practice Standards	Indicators: The student...	Student Strength	Student area for Growth
Exploring Changing Quantities	Number Flexibility to 100	<b>SMP.3:</b> Construct viable arguments and critique the reasoning of others. <b>SMP.4:</b> Model with mathematics. <b>SMP.5:</b> Use appropriate tools strategically.	-Computes products and quotients within 100 -Justifies solutions using appropriate tools or models -Constructs arguments with clear reasoning to support solutions	TBT	TBT
Taking Wholes Apart, Putting Parts Together	Square Tiles	<b>SMP.2:</b> Reason abstractly and quantitatively. <b>SMP.5:</b> Use appropriate tools strategically.	-Measures area using square tiles as tools -Connects the area of individual square tiles to area of entire shape's area using fractions.	TBT	TBT
Taking Wholes Apart, Putting Parts Together	Fractions of shape and time	<b>SMP.2:</b> Reason abstractly and quantitatively. <b>SMP.4:</b> Model with mathematics <b>SMP.7:</b> Look for and make use of structure	-Collects and organizes multivariable data in relationship to time -Creates connections that highlight the relationship between measures of time including minutes, quarter, and half hours.	TBT	TBT
Taking Wholes Apart, Putting Parts Together	Fractions as relationships	<b>SMP.2:</b> Reason abstractly and quantitatively. <b>SMP.7:</b> Look for and make use of structure	-Interprets the relationship between the numerator and denominator of fractions-- especially in context -Recognizes and connects equivalent fractions to one another.	TBT	TBT
Taking Wholes Apart, Putting Parts Together	Unit Fraction Models	<b>SMP.3:</b> Construct viable arguments and critique the reasoning of others. <b>SMP.4:</b> Model with mathematics	-Uses visual models to compare unit fractions -Justifies arguments about unit fractions using visual models	TBT	TBT

Content Connections	Big ideas	Mathematical Practice Standards	Indicators: The student...	Student Strength	Student area for Growth
Discovering Shape and Space	Analyze Quadrilaterals	<b>SMP.2:</b> Reason abstractly and quantitatively. <b>SMP.4:</b> Model with mathematics	-Compares quadrilaterals based on various features -Investigates how area and perimeter change when side lengths change. -Solves real world problems involving area and perimeter of quadrilaterals through modeling.	TBT	TBT
Discovering Shape and Space	Fractions as Relationships	<b>SMP.2:</b> Reason abstractly and quantitatively. <b>SMP.4:</b> Model with mathematics	-Creates visual representations that model fractions -Justifies how a model represents a fractional quantity by relating the numerator, denominator and visual.	TBT	TBT
Discovering Shape and Space	Unit Fraction Models	<b>SMP3:</b> Construct viable arguments and critique the reasoning of others. <b>SMP4:</b> Model with mathematics	-Uses visual models to compare unit fractions by attending to differences in scale -Justifies arguments about unit fractions using visual models	TBT	TBT

## 124 Two Types of Assessment

125 There are two general types of assessment, formative and summative. **Formative**

126 **assessment**, commonly referred to as assessment *for* learning, has the goal of  
127 providing in-process information to teachers, and students, with regard to learning.

128 Formative assessment is a process teachers and students use during instruction that  
129 provides feedback to adjust ongoing teaching moves and learning tactics. It is not a tool,  
130 an event, or a bank of test items or performance tasks. The following definition of

131 formative assessment comes from the *English Language Arts/English Language*  
132 *Development Framework (ELA/ELD Framework, CDE, 2014)*:

133 **What is formative assessment?** Formative assessment is a *process* teachers and  
134 students use *during* instruction that provides feedback to adjust ongoing teaching  
135 moves and learning tactics. It is *not* a tool or an event, nor a bank of test items or  
136 performance tasks. Well-supported by research evidence, it improves students' learning  
137 in time to achieve intended instructional outcomes. Key features include:

- 138 1. **Clear lesson-learning goals and success criteria**, so students understand  
139 what they're aiming for;
- 140 2. **Evidence of learning** gathered *during lessons* to determine where students are  
141 relative to goals;
- 142 3. **A pedagogical response to evidence, including descriptive feedback** that  
143 supports learning by helping students answer: *Where am I going? Where am I*  
144 *now? What are my next steps?*
- 145 4. **Peer- and self-assessment** to strengthen students' learning, efficacy,  
146 confidence, and autonomy;
- 147 5. **A collaborative classroom culture** where students and teachers are partners in  
148 learning.

149 From Linqanti (2014, 2).

150 Ongoing research and evidence on formative assessment illustrates how it improves  
151 students' learning in time to achieve intended instructional outcomes (CDE, 2014). The  
152 CAASPP system encompasses both formative and summative assessment resources,  
153 and reflects the work of the Smarter Balanced Assessment Consortium, which further  
154 defines formative assessment in the context of the system (Regents of the University of  
155 California, 2021).

156 **Summative assessment**, commonly referred to as assessment *of* learning, has the  
157 goal of collecting information on a student's achievement *after* learning has occurred.  
158 Summative assessment measures include classroom, interim or benchmark  
159 assessments, and large-scale summative measures, such as the CAASPP or SAT.

160 Summative assessments help determine whether students have attained a certain level  
161 of competency after a more or less extended period of instruction and learning; such as  
162 the end of a unit which may last several weeks, the end of a quarter, or annually  
163 (National Research Council [NRC], 2001).

164 Regardless of the type or purpose of an assessment, teachers should keep in mind that  
165 the UDL principles call for students to be provided multiple means of action and  
166 expression. An illustration of this can be as simple as allowing students the option to  
167 talk through their solution by pointing and verbalizing (instead of requiring writing), or  
168 using arrows and circles to highlight particular pieces of evidence in their solution rather  
169 than repeating statements in their explanation. Providing a variety of ways for students  
170 to showcase what they can do and what they know is especially important in  
171 mathematics assessments. Aligning assessment with one or more UDL principles can  
172 better inform the teacher of what students are learning, and multiple means of  
173 representation, whether used to inform formative assessment of daily progress or as a  
174 summative display of enduring mathematical understanding, can create a complex and  
175 diverse mosaic of student achievement.

176 An underlying question for teachers as they design, implement, and adapt assessments  
177 to be effective for all students is: How can students demonstrate what they know in a  
178 variety of ways? Increased use of distance learning during the pandemic has caused a  
179 shift in assessment practices which has distinct benefits for students being able to show  
180 their understanding in alternative ways. For example, students can video record their  
181 thinking related to a task or they can post answers in a live chat or anonymous poll. By  
182 considering and planning for the variety of ways in which students can demonstrate  
183 their skills and knowledge, they are better able to provide teachers with the information  
184 on what they succeed in doing, and where their challenges are.

185 The main differences between formative and summative assessment are outlined in  
 186 Figure 12.2, which comes from the *ELA/ELD Framework*.

187 Figure 12.2: Key Dimensions of Assessment **for** Learning and Assessment **of** Learning  
 188 Assessment: A process of Reasoning from Evidence to Inform Teaching and Learning

<b>Dimension</b>	<b>Assessment for learning</b>	<b>Assessment of learning</b>	<b>Assessment of learning</b>
<b>Method</b>	<b>Formative Assessment Process</b>	<b>Classroom Summative/ Interim/Benchmark Assessment*</b>	<b>Large-scale Summative Assessment</b>
<b>Main Purpose</b>	Assist immediate learning (in the moment)	Measure student achievement or progress (may also inform future teaching and learning)	Evaluate educational programs and measure multi-year progress
<b>Focus</b>	Teaching and learning	Measurement	Accountability
<b>Locus</b>	Individual student and classroom learning	Grade level/ department/school	School/district/state
<b>Priority for Instruction</b>	High	Medium	Low
<b>Proximity to learning</b>	In-the-midst	Middle-distance	Distant
<b>Timing</b>	<i>During</i> immediate instruction or sequence of lessons	<i>After</i> teaching-learning cycle → <i>between</i> units/periodic	<i>End of year/course</i>
<b>Participants</b>	Teacher and Student (T-S / S-S / Self)	Student (may later include T-S in conference)	Student

189 Adapted from Linqanti (2014).

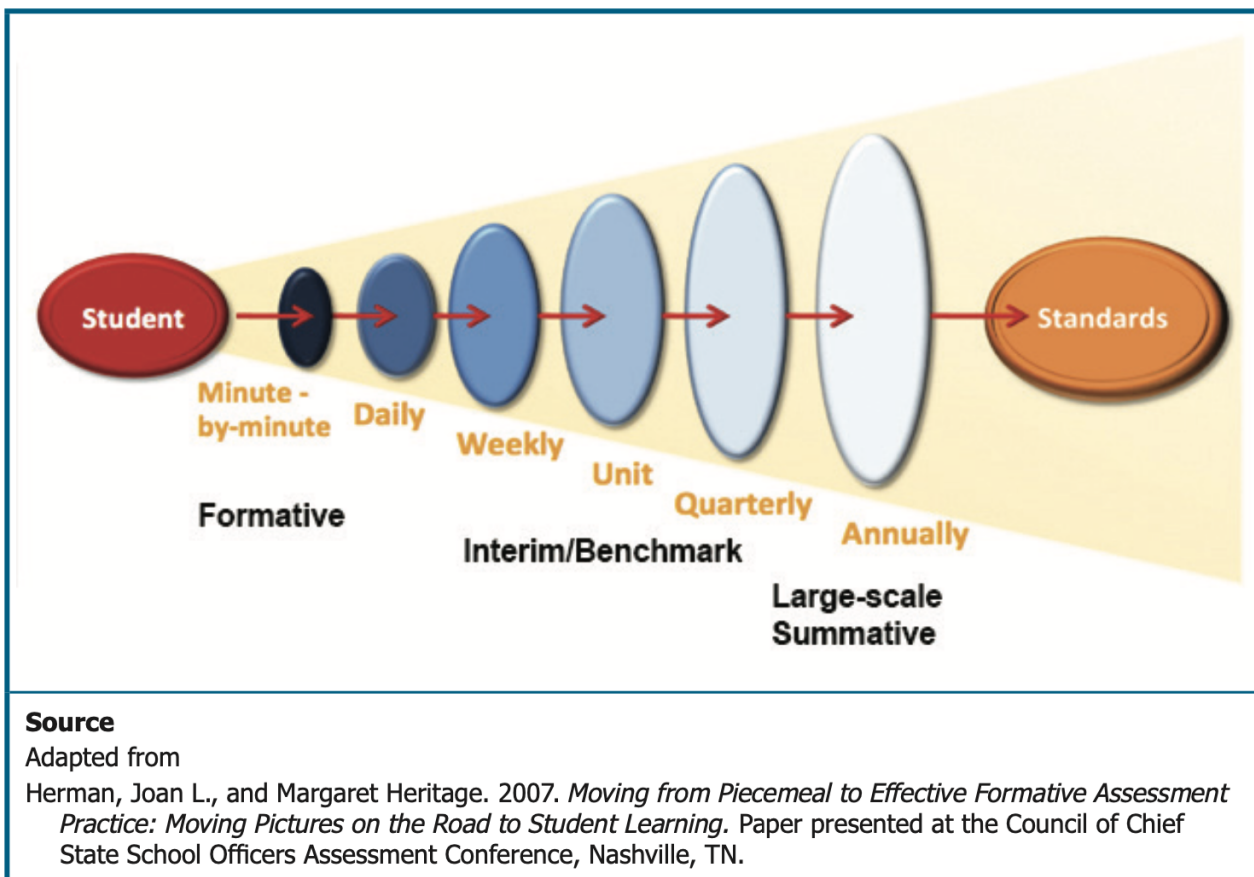

190 \*Assessment of learning may also be used for formative purposes *if* assessment  
 191 evidence is used to shape future instruction. Such assessments include weekly quizzes;  
 192 curriculum embedded within-unit tasks (e.g., oral presentations, writing projects,  
 193 portfolios) or end-of-unit/culminating tasks; monthly writing samples, reading

194 assessments (e.g., oral reading observation, periodic foundational skills assessments);  
195 and student reflections/self-assessments (e.g., rubric self-rating).

196 Source: CDE, 2014, Chapter 8.

197 The different purposes of assessment cycles are set out in Figure 12.3, from the  
198 *ELA/ELD Framework*.

199 Figure 12.3

200

201 [Link to long description](#)

202 These are further exemplified in the following short-, medium-, and long-cycle tables

203 from the *ELA/ELD Framework*.

<b>Short Cycle</b>	<b>Methods</b>	<b>Information</b>	<b>Uses/Actions</b>
<b>Minute-by-minute</b>	<ul style="list-style-type: none"> <li>-Observation</li> <li>-Questions (teachers and students)</li> <li>-Instructional tasks</li> <li>-Student discussions</li> <li>-Written work/ representations</li> </ul>	<ul style="list-style-type: none"> <li>-Students' current learning status, relative difficulties and misunderstandings, emerging or partially formed ideas, full understanding</li> </ul>	<ul style="list-style-type: none"> <li>-Keep going, stop and find out more, provide oral feedback to individuals, adjust instructional moves in relation to student learning status (e.g., act on "teachable moments")</li> </ul>
<b>Daily Lesson</b>	<p>Planned and placed strategically in the lesson:</p> <ul style="list-style-type: none"> <li>-Observation</li> <li>-Questions (teachers and students)</li> <li>-Instructional tasks</li> <li>-Student discussions</li> <li>-Written work/ representations</li> <li>-Student self-reflection (e.g., quick write)</li> </ul>	<ul style="list-style-type: none"> <li>-Students' current learning status, relative difficulties and misunderstandings, emerging or partially formed ideas, full understanding</li> </ul>	<ul style="list-style-type: none"> <li>-Continue with planned instruction</li> <li>-Instructional adjustments in this or the next lesson</li> <li>-Find out more</li> <li>-Feedback to class or individual students (oral or written)</li> </ul>
<b>Week</b>	<ul style="list-style-type: none"> <li>-Student discussions and work products</li> <li>-Student self-reflection (e.g., journaling)</li> </ul>	<ul style="list-style-type: none"> <li>-Students' current learning status relative to lesson learning goals (e.g., have students met the goal(s), are they nearly there?)</li> </ul>	<ul style="list-style-type: none"> <li>-Instructional planning for start of new week</li> <li>-Feedback to students (oral or written)</li> </ul>

<b>Medium Cycle</b>	<b>Methods</b>	<b>Information</b>	<b>Uses/Actions</b>
<b>End-of-Unit/ Project</b>	<ul style="list-style-type: none"> <li>-Student work artifacts (e.g., portfolio, writing project, oral presentation)</li> <li>-Use of rubrics</li> <li>-Student self-reflection (e.g., short survey)</li> <li>-Other classroom summative assessments designed by teacher(s)</li> </ul>	<ul style="list-style-type: none"> <li>-Status of student learning relative to unit learning goals-</li> </ul>	<ul style="list-style-type: none"> <li>-Grading</li> <li>-Reporting</li> <li>-Teacher reflection on effectiveness of planning and instruction</li> <li>-Teacher grade level/departmental discussions of student work</li> </ul>
<b>Quarterly/ Interim/ Benchmark</b>	<ul style="list-style-type: none"> <li>-Portfolio</li> <li>-Oral reading observation</li> <li>-Test</li> </ul>	<ul style="list-style-type: none"> <li>-Status of achievement of intermediate goals toward meeting standards (results aggregated and disaggregated)</li> </ul>	<ul style="list-style-type: none"> <li>-Making within-year instructional decisions.</li> <li>-Monitoring, reporting; grading; same-year adjustments to curriculum programs</li> <li>-Teacher reflection on effectiveness of planning and instruction</li> <li>-Readjusting professional learning priorities and resource decisions</li> </ul>

Long Cycle	Methods	Information	Uses/Actions
<b>Annual</b>	<ul style="list-style-type: none"> <li>-Smarter Balanced Summative Assessment</li> <li>-ELPAC</li> <li>-Portfolio</li> <li>-District/school created test</li> </ul>	Status of student achievement with respect to standards (results aggregated and disaggregated)	<ul style="list-style-type: none"> <li>-Judging students' overall learning</li> <li>-Gauging student, school, district, and state year-to-year progress</li> <li>-Monitoring, reporting and accountability</li> <li>- Classification and placement (e.g., ELs)</li> <li>-Certification</li> <li>-Adjustments to following year's instruction, curriculum, programs;</li> <li>-Final grades</li> <li>-Professional learning prioritization and resource decisions</li> <li>-Teacher reflection (individual/grade level/department) on overall effectiveness of planning and instruction</li> </ul>

206 Source: CDE, 2014, Chapter 8.

207 Note: The California English Language Development Test (CELDT) has been replaced  
 208 by the English Learner Proficiency Assessment for Californian (ELPAC).

## 209 **Formative Assessment**

210 Formative assessment is the collection of evidence to provide day-to-day feedback to  
211 students and teachers, so that teachers can adapt their instruction and students  
212 become self-aware learners who take responsibility for their learning. Formative  
213 assessment is typically classroom-based and in-sync with instruction, such as analyzing  
214 classroom conversations or over-the-shoulder observations of students' diagrams, work,  
215 questions, and conversations. There are a number of aspects to effective formative  
216 assessment including embedded formative assessment, rubrics, teacher diagnostic  
217 comments, self and peer assessment.

218 A central goal of formative assessment is encouragement of students to take  
219 responsibility for their learning. When teachers communicate to the students where they  
220 are now, where they need to be, and ways to close the gap between the two places,  
221 they provide valuable information to students that enhances their learning. In Black and  
222 Wiliam's landmark study (1998) considering the evidence from hundreds of research  
223 studies on assessment, they found that if teachers shifted their practices and used  
224 predominantly formative assessment, it would raise the achievement of a country, as  
225 measured in international studies, from the middle of the pack to a place in the top five.  
226 In addition, Black and Wiliam found that if teachers were to assess students formatively,  
227 then the positive impact would outweigh that of other educational initiatives, such as  
228 reductions in class size (Black et al., 2002; Black and Wiliam, 1998). The following  
229 table, taken from *Principles to Actions* (NCTM, 2014, 56), provides helpful insight into  
230 specific teacher and student actions in a formative assessment setting.

231 Figure 12.4: Elicit and Use Evidence of Student Thinking – Teacher and Student  
232 Actions

What are teachers doing?	What are students doing?
<ul style="list-style-type: none"> <li>• Identifying what counts as evidence of student progress toward mathematics learning goals.</li> <li>• Eliciting and gathering evidence of student understanding at strategic points during instruction.</li> <li>• Interpreting student thinking to assess mathematical understanding, reasoning, and methods.</li> <li>• Making in-the-moment decisions on how to respond to students with questions and prompts that probe, scaffold, and extend.</li> <li>• Reflecting on evidence of student learning to inform the planning of next instructional steps.</li> </ul>	<ul style="list-style-type: none"> <li>• Revealing their mathematical understanding, reasoning, and methods in written work and classroom discourse.</li> <li>• Reflecting on mistakes and misconceptions to improve their mathematical understanding.</li> <li>• Asking questions of their peers, and responding to questions from their peers, and giving suggestions to support the learning of their classmates.</li> <li>• Assessing and monitoring their own progress toward mathematics learning goals and identifying areas in which they need to improve.</li> </ul>

233 **Formative Assessment Lessons**

234 One of the strengths of formative assessment is the flexibility, both in timing and  
 235 approach, that it affords a classroom teacher. Indeed, one can argue that there are a  
 236 myriad number of possibilities for teachers to conduct formative assessment throughout  
 237 a lesson, such as monitoring the types of questions students are asking, the responses  
 238 students are sharing to questions, and the quality of content in peer conversations.  
 239 And—though much of this may be unplanned—when formative assessment is  
 240 intentionally included in a daily lesson plan, the data and analysis are even more  
 241 effective.

242 When teachers notice and make sense of student thinking they are given an opportunity  
 243 to assess formatively (Carpenter et al., 2014; Fernandes, Crespo, and Civil, 2017). The  
 244 NCTM Principles to Action state that “[e]ffective teaching of mathematics uses evidence  
 245 of student thinking to assess progress toward mathematical understanding and to adjust

246 instruction continually in ways that support and extend learning” (NCTM, 2014).  
247 Complex Instruction is a pedagogical approach that provides an example of the ways  
248 student discussions can provide teachers with formative assessment. Complex  
249 Instruction centers upon three principles for creating equity in heterogeneous  
250 classrooms through groupwork (Cohen and Lotan, 2014). The first principle involves  
251 students developing responsibility for each other, serving as academic and linguistic  
252 resources for one another (Cabana, Shreve, and Woodbury, 2014). The second  
253 principle involves students working together to complete tasks (Cohen and Lotan,  
254 2014). To realize this principle, teachers must manage equal participation in groups by  
255 valuing and highlighting a wide range of abilities and attending to issues of status  
256 amongst students (Cohen and Lotan, 2014; Tsu, Lotan, and Cossey, 2014). During  
257 groupwork, the teacher looks for opportunities to elevate students by highlighting their  
258 abilities and contributions to the group, which is referred to as “assigning competence”  
259 (Boaler and Staples, 2014). This principle recognizes the fact that group interactions  
260 often create status differences between students—and when a teacher perceives that a  
261 student has become “low status” in a group, they intervene by publicly praising a  
262 mathematical contribution they have made. Underlying these two principles is a third:  
263 the implementation of multi-dimensional, group-worthy tasks, which are challenging,  
264 open-ended, and require a range of ways of working (Cohen and Lotan, 1997; Banks,  
265 2014; LaMar, Leshin, and Boaler, 2020). As teachers work to manage heterogeneous  
266 groupwork and assign competence they will encounter opportunities to listen to student  
267 thinking and to assess formatively. Teachers are encouraged to plan for student  
268 groupings or pairings with language proficiencies in mind. Groupings should be flexible  
269 and purposeful and should not be exclusively by proficiency levels, as this can create in-  
270 class tracking. English learners need opportunities to interact with peers who are native  
271 speakers of English, and to be provided access to language models and authentic  
272 opportunities to use their developing language skills.

---

273 ***Snapshot: A teacher tries a new assessment approach.***

274 Vince is an experienced high school teacher who has been teaching for over 20 years in  
275 diverse classrooms, including linguistically and culturally diverse English learners and

276 students with learning differences. Vince uses a traditional system of testing and  
277 grading in his classroom, but recently read about assessment for learning and  
278 wondered if the summative assessments he had been using could be used in a  
279 formative manner. Instead of giving tests as summative assessments, as he had in  
280 previous years, he decided to ask students to answer as many problems as they could.

281 Before beginning, Vince reviewed the questions as class to be sure everyone  
282 understood the directions, or words that may have multiple meanings. This ensured that  
283 all students had access to the questions. In consideration of Universal Design for  
284 Learning (UDL), he also briefly discussed the multiple modes of expressing their  
285 thinking that could be used, including diagrams, words, equations, tables, and  
286 flowcharts to show steps. When students identified questions which were too difficult  
287 and they could not answer them, he asked them to mark these questions and then use  
288 the help of a resource—such as a book or class notes, or translation software—in  
289 working out solutions. When students finished the assessment, the work they had done  
290 on the marked problems became the work they discussed in class. Vince made sure  
291 that as many voices were included in the conversation and that visuals were used.  
292 Vince said that the discussions gave him the best information he had ever had on his  
293 students' understanding of the mathematics he was teaching.

294 A rich repository of free lessons supporting teachers in formative assessment are the  
295 Classroom Challenges housed at the Mathematics Assessment Resource Service  
296 (MARS). Each lesson is structured around an active learning experience for students  
297 with a rich task and teachers are provided with common issues to look for in student  
298 responses to questions, as well as samples of, and guidance for, analyzing student  
299 work.

300 “Maximizing Area: Gold Rush” is a sample grade-seven lesson with following guide to  
301 address common student questions. This lesson exemplifies how teachers can adjust  
302 their questioning strategies for students based on formative assessment data regarding  
303 student misconceptions (University of Nottingham, 2016).

304 Gold Rush

305 Background: In the 19th Century, many prospectors travelled to North America to  
306 search for gold. A man named Dan Jackson owned some land where gold had been  
307 found. Instead of digging for the gold himself, he rented plots of land to the prospectors.

308

309 Problem: Dan gave each prospector four wooden stakes and a rope measuring exactly  
310 1000 meters. Each prospector had to use the stakes and the rope to mark off a  
311 rectangular plot of land.

312

313 1. Assuming each prospector would like to have the biggest plot, what should the  
314 dimensions of the plot be, once he places his stakes. Explain your answer.

315 2. Read the following statement:

316 "Join the ropes together! You can get more land if you work together than  
317 if you work separately."

318 Investigate whether the statement is true for two or more prospectors working  
319 together, sharing the plot equally, and still using just four stakes. Explain your  
320 answer.

Common Issues	Suggested Questions and Prompts
Does not understand the concept of an area and/or perimeter or does not know how to find the area or perimeter of a rectangle	<ul style="list-style-type: none"> <li>• What does the length of a rope given to a prospector measure?</li> <li>• How could you measure the amount of land enclosed by the rope?</li> <li>• How do you find the area of a rectangle?</li> <li>• How do you find the perimeter of a rectangle?</li> </ul>
Calculates the total amount of land, but not the amount of land for each prospector (Q2)	<ul style="list-style-type: none"> <li>• You've worked out the total area of land for both/all of the prospectors; how much land will each prospector get?</li> </ul>
Emphasizes only the human impact of sharing the land (Q2) For example: The students states that when two people share they can help each other out. Or: The student states that when sharing the land people are more likely to steal from each other.	<ul style="list-style-type: none"> <li>• Now investigate if combining ropes affects the amount of land each prospector gets</li> </ul>
Does not investigate any or very few rectangles For example: The student draws just one rectangle and calculates its area (Q1).	<ul style="list-style-type: none"> <li>• Now investigate the area of several different rectangles with the same perimeter, but different dimensions.</li> </ul>
Works unsystematically	<ul style="list-style-type: none"> <li>• How can you now organize your work?</li> <li>• How do you know for sure your answer is the best option?</li> </ul>
Presents work poorly For example: The student presents the work as a series of unexplained numbers and/or calculations.	<ul style="list-style-type: none"> <li>• Would someone unfamiliar with this work understand your method?</li> </ul>
Only investigates two prospectors sharing land	<ul style="list-style-type: none"> <li>• Suppose 3/4/5 prospectors share land. What area of land would each prospector get?</li> </ul>

321 **Rubrics**

322 Although rubrics are often used by teachers as a tool to evaluate summative work and  
323 identify more reliable scores when grading student work, rubrics lend themselves to the  
324 formative assessment process because they can provide students with a clear set of  
325 expectations to achieve as they learn, and ultimately serve as success criteria for  
326 summative assessments. Rubrics help students, parents, and teachers identify what

327 quality work is. Students can judge their own work and accept more responsibility of the  
328 final product. Parents have a clear understanding of what is expected for tasks which  
329 helps them understand what it takes to meet or exceed a standard and what further  
330 learning needs to take place.

331 A rubric can provide parameters for the mathematics students are learning and enable  
332 them to develop self-awareness and to reflect on their own progress. It is not  
333 uncommon for students to carefully answer questions in lessons, but experience  
334 difficulty when connecting their learning to the broader mathematical landscape. Use of  
335 a rubric enables students to assess their own learning as well as their peers; it also  
336 allows the teacher to provide comments to guide students to making important  
337 connections to other areas of their mathematical knowledge. In creating rubrics,  
338 teachers should be mindful of the variety of ways in which students can demonstrate  
339 their knowledge. Rubrics that are outcomes-based, as opposed to skill-specific, can  
340 provide multiple modes of engagement for students during instruction and encourage  
341 teachers to develop multiple options for students to showcase their skills and  
342 knowledge. For example, teachers can provide colored tape so students can make tape  
343 diagrams rather than drawing each section of tape and shading. Or teachers can use a  
344 camera to take a sequence of images to document students' work while using  
345 manipulatives, such as integer chips, to solve a problem, thus sparing students from  
346 otherwise rote activities of copying and drawing.

347 As seen in the rubric examples provided below, the criteria can focus on the  
348 mathematical practices, mathematical content, or both. The following two rubrics,  
349 created at the Stanford Center for Assessment Learning and Equity (SCALE),  
350 communicate the mathematical practices in a form that students can use to monitor  
351 their own progress and learning (Dieckmann and Kokka, 2016):

Practice	Not Yet	Approaches	Achieves	Masters
<p>Make sense of problems and persevere in solving them</p>	<ul style="list-style-type: none"> <li>• I need assistance from my teacher to understand what the problem or question asks me to do.</li> <li>• I am unsure how to connect this problem or question to what I already know.</li> <li>• I am still working to organize the information in this problem or question.</li> </ul>	<ul style="list-style-type: none"> <li>• I have a partial understanding of what a problem or question asks me to do. I am working on this to make the connection stronger.</li> <li>• I show partial connection between this question and what I already know. I am working on this to make the connection stronger.</li> <li>• I organized some of the information in this question or problem but missed some important information.</li> </ul>	<ul style="list-style-type: none"> <li>• I explain questions and problems in my own words.</li> <li>• I relate questions and problems to similar things I have seen before.</li> <li>• I organize given information before attempting to solve. I check to make sure that my final solution makes sense and is reasonable.</li> </ul>	<ul style="list-style-type: none"> <li>• Achieves, and also: My work includes a reflection of how I monitored myself while I was working and adjusted my plan when necessary.</li> </ul>

Practice	Not Yet	Approaches	Achieves	Masters
Reason abstractly and quantitatively	<ul style="list-style-type: none"> <li>I am still working to translate between my math work (symbols, calculations) and real-world situations. I currently do this with the assistance of my teacher.</li> </ul>	<ul style="list-style-type: none"> <li>I show and explain what some of my math work (symbols, calculations) means in real-life contexts.</li> </ul>	<ul style="list-style-type: none"> <li>I show and explain what all or most of my math work (symbols, calculations) mean in real-life contexts.</li> <li>I pay attention to the meaning of quantities, not just how to compute them.</li> </ul>	<ul style="list-style-type: none"> <li>Achieves, and also: I describe my solution and any limitations in terms of the real-world context described within the problem.</li> </ul>

352 **Math Performance Assessment Rubric (Grades Nine through Twelve)**

353 The ability to reason, problem-solve, develop sound arguments or decisions, and create  
354 new ideas by using appropriate sources and applying the knowledge and skills of a  
355 discipline.

356 Criteria: Problem Solving

357 *What is the evidence that the student understands the problem and the mathematical*  
358 *strategies that can be used to arrive at a solution?*

359 Measurement: Emerging

- 360 • Does not provide a model
- 361 • Ignores given constraints
- 362 • Uses few, if any, problem-solving strategies

363 Measurement: Developing

- 364 • Creates a limited model to simplify a complicated situation
- 365 • Attends to some of the given constraints
- 366 • Use inappropriate or inefficient problem-solving strategies

367 Measurement: Proficient

- 368 • Creates a model to simplify a complicated situation
- 369 • Analyzes all given constraints, goals and definitions
- 370 • Uses appropriate problem-solving strategies

371 Measurement: Advanced

- 372 • Creates a model to simplify a complicated situation and identifies limitations of  
373 model
- 374 • Analyzes all given constraints, goals, and definitions and implied assumptions
- 375 • Uses novel problem-solving strategies and/or strategic use of tools

376 Criteria: Reasoning and Proof

377 *What is the evidence that the student can apply mathematical reasoning/procedures in*  
378 *an accurate and complete manner?*

379 Measurement: Emerging

- 380 • Provides incorrect solutions without justifications
- 381 • Results are not interpreted in terms of context.

382 Measurement: Developing

- 383 • Provides partially correct solutions or correct solution without logic or justification
- 384 • Results are interpreted partially or incorrectly in terms of context.

385 Measurement: Proficient

- 386 • Constructs logical, correct, complete solution
- 387 • Results are interpreted correctly in terms of context

388 Measurement: Advanced

- 389 • Constructs logical, correct, complete solution with justifications
- 390 • Interprets results correctly in terms of context, indicating the domain to which a  
391 solution applies
- 392 • (Monitors for reasonableness, identifies sources of error, and adapts  
393 approximately)

394 Criteria: Connections

395 *What is the evidence that the student understands the relationships between the*  
396 *concepts, procedures, and/or real-world applications inherent in the problem?*

397 Measurement: Emerging

- 398 • Little or no evidence of applying previous math knowledge to given problem

399 Measurement: Developing

- 400 • Applies previous math knowledge to given problem but may include reasoning or  
401 procedural errors

402 Measurement: Proficient

- 403 • Applies and extends math previous knowledge correctly to given problem

404 Measurement: Advanced

- 405 • Applies and extends previous knowledge correctly to given problem; makes  
406 appropriate use of derived results
- 407 • (Identifies and generalizes the underlying structures of the given problem to other  
408 seemingly unrelated problems or applications

409 Criteria: Communication and Representation

410 *What is the evidence that the student can communicate mathematical ideas to others?*

411 Measurement: Emerging

- 412 • Uses representations (diagrams, tables, graphs, formulas) in ways that confuse  
413 the audience
- 414 • Uses incorrect definitions or inaccurate representations

415 Measurement: Developing

- 416 • Uses representations (diagrams, tables, graphs, formulas), though correct, do  
417 not help the audience follow the chain of reasoning; extraneous representations  
418 may be included
- 419 • Uses imprecise definitions or incomplete representations with missing units of  
420 measure or labeled axes

421 Measurement: Proficient

- 422 • Uses multiple representations (diagrams, tables, graphs, formulas) to help the  
423 audience follow the chain of reasoning
- 424 • With few exceptions, uses precise definitions and accurate representations  
425 including units of measure and labeled axes

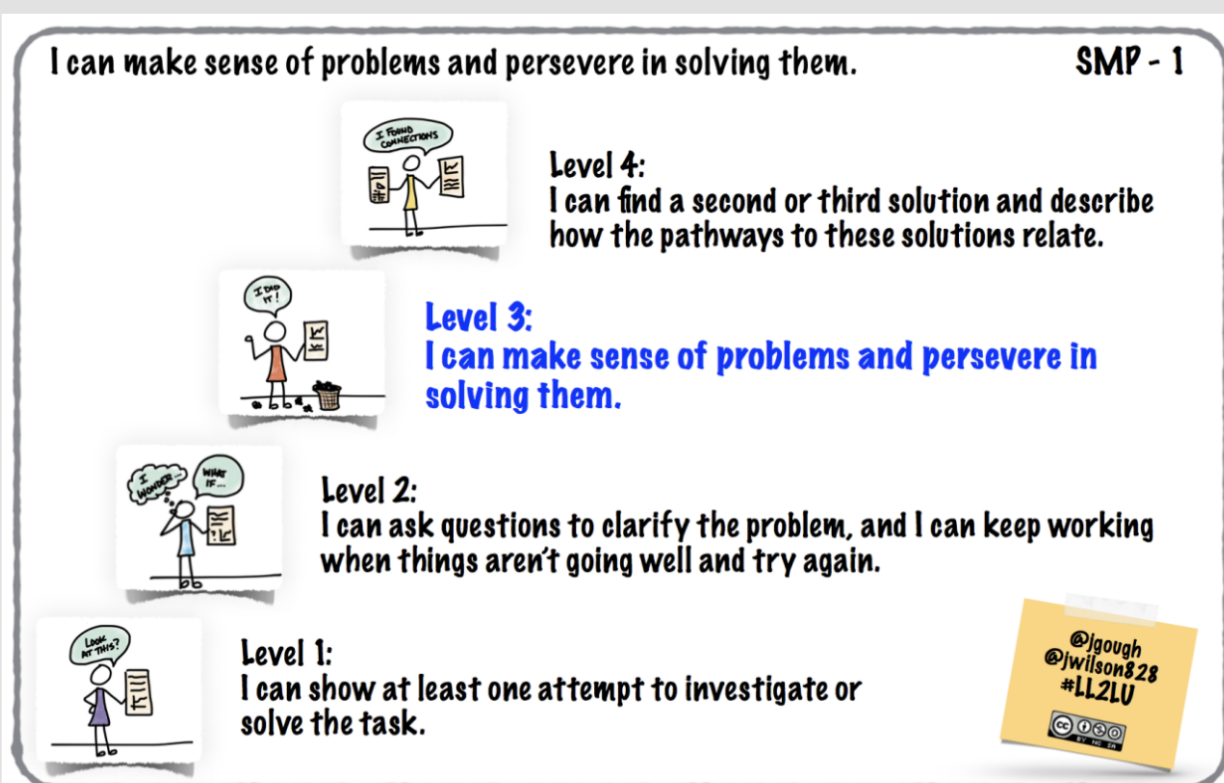

426 Measurement: Advanced

- 427
- Uses multiple representations (diagrams, tables, graphs, formula) and key explanations to enhance the audience's understanding of the solution; only relevant representations are included
- 428
- 429
- Uses precise definitions and accurate representations including units of measure and labeled axes; uses formal notation
- 430
- 431
- 432 (SCALE et al., 2013).

433 Another mathematical practice rubric that communicates outcomes in language written  
434 for students is given by Jennifer Wilson:

435 An example of SMP.1 is shown below:

**I can make sense of problems and persevere in solving them.** **SMP - 1**

**Level 4:**  
I can find a second or third solution and describe how the pathways to these solutions relate.

**Level 3:**  
I can make sense of problems and persevere in solving them.

**Level 2:**  
I can ask questions to clarify the problem, and I can keep working when things aren't going well and try again.

**Level 1:**  
I can show at least one attempt to investigate or solve the task.

436

437 [Link to long description](#)

438 Source: Wilson, 2017.

439 The following rubric from the 2013 *Mathematics Framework* provides criteria based on a  
440 Smarter Balanced Sample Performance Task and Scoring Rubric.

441 Performance Task

442 *Part A*

443 Ana is saving to buy a bicycle that costs \$135. She has saved \$98 and wants to know  
444 how much more money she needs to buy the bicycle.

445 The equation  $135 = x + 98$  models this situation, where  $x$  represents the additional  
446 amount of money Ana needs to buy the bicycle.

- 447 • When substituting for  $x$ , which value(s), if any, from the set  $\{0, 37, 08, 135, 233\}$   
448 will make the equation true?
- 449 • Explain what this means in terms of the amount of money needed and the cost of  
450 the bicycle.

451 *Part B*

452 Ana considered buying the \$135 bicycle, but then she decided to shop for a different  
453 bicycle. She knows the other bicycle she likes will cost more than \$150.

454 This situation can be modeled by the following inequality:

- 455 • Which values, if any, from -250 to 250 will make the inequality true? If more than  
456 one value makes the inequality true, identify the least and greatest values that  
457 make the in- equality true.
- 458 • Explain what this means in terms of the amount of money needed and the cost of  
459 the bicycle.

460 Sample Top-Score Response:

461 *Part A*

- 462 • The only value in the given set that makes the equation true is 37. This means  
463 that Ana will need exactly \$37 more to buy the bicycle.

464 *Part B*

- 465 • The values from 53 to 250 will make the inequality true. This means that Ana will  
466 need from \$53 to \$250 to buy the bicycle.

467

### Scoring Rubric:

468

*Responses to this item will receive 0–3 points, based on the following descriptions.*

469

3 points: The student shows a thorough understanding of equations and inequalities in a contextual scenario, as well as a thorough understanding of substituting values into equations and inequalities to verify whether they satisfy the equation or inequality. The student offers a correct interpretation of the equality and the inequality in the correct context of the problem. The student correctly states that 37 will satisfy the equation and that the values from 53 to 250 will satisfy the inequality.

475

2 points: The student shows a thorough understanding of substituting values into equations and inequalities to verify whether they satisfy the equation or inequality, but limited understanding of equations or inequalities in a contextual scenario. The student correctly states that 37 will satisfy the equation and that the values from 53 to 250 will satisfy the inequality, but the student offers an incorrect interpretation of the equality or the inequality in the context of the problem.

481

1 point: The student shows a limited understanding of substituting values into equations and inequalities to verify whether they satisfy the equation or inequality and demonstrates a limited understanding of equations and inequalities in a contextual scenario. The student correctly states that 37 will satisfy the equation, does not state that the values from 53 to 250 will satisfy the inequality, and offers incorrect interpretations of the equality and the inequality in the context of the problem. OR The student correctly states that the values from 53 to 250 will satisfy the inequality, does not state that 37 satisfies the equation, and offers incorrect interpretations of the equality and the inequality in the context of the problem.

490

0 points: The student shows little or no understanding of equations and inequalities in a contextual scenario and little or no understanding of substituting values into equations and inequalities to verify whether they satisfy the equation or inequality. The student offers incorrect interpretations of the equality and the inequality in the context of the

494 problem, does not state that 37 satisfies the equation, and does not state the values  
495 from 53 to 250 will satisfy the equation.

496 An engaging mathematics task that draws from mathematical and scientific  
497 understanding, is provided in the *Science Framework* (CDE, 2018). The task is  
498 accompanied by a rubric, that the teacher, Mr. A, used to assess the students' work:

---

---

499 ***Assessment Snapshot: Mathematical Thinking for Early Elementary***

500 Mr. A's kindergarten class is conducting an investigation when they realize that they  
501 need to use **mathematical thinking [SEP-5]**. Mr. A's class receives a package of  
502 silkworm eggs and is amazed how they all hatch on almost the same day! One student  
503 asks how quickly they will grow and another wonders how big they will get. The  
504 students decide that they would like to track the **growth [CCC-7]** of their silkworms and  
505 measure them daily. Mr. A wants the students to come up with a way to answer the  
506 question, "How **big [CCC-3]** are they today?" through a visual display of their  
507 measurement data. The students need to find a way to summarize all their  
508 measurements using a graphical display. Mr. A was guided by research about the  
509 different developmental levels in understanding how to display data (table 9.4).

510 **Developmental Levels of the Ability to Display Data**

Level	Descriptor
6	Create and use data representations to notice trends, patterns, and be able to recognize outliers.
5	Create and use data representations that recognize scale as well as trends or patterns in data.
4	Represent data using groups of similar values and apply consistent scale to the groups.
3	Represent data using groups of similar values (though groups are inconsistent).
2	Identify the quantity of interest, but only consider each case as an individual without grouping data together
1	Group data in ways that don't relate to the problem of interest.

511 Source: Adapted from NRC, 2014

512 One group orders each of the 261 measurements by magnitude, making a bar for each  
513 worm. The display uses a full 5 feet of wall space! (figure 9.A; level 2 on table 9.4).  
514 Another group makes a bar graph with a bin size of just 1 mm per bin, which leads to 50  
515 different bars (figure 9.13B; level 4 on table 9.4). Also, this group's vertical axis only  
516 extends to six worms at the top of the paper, so bars with more than six worms and got  
517 cut off. A third group creates a more traditional bar graph with measurements placed  
518 into bins. Rather than using bars, the group uses circles stacked one on top of the  
519 other. Unfortunately, different students draw the circles for each bin and they are not the  
520 same size and therefore not comparable (figure 9.13C; level 3 on table 9.4).

521 Mr. A leads a discussion about which representations are most useful for understanding  
522 silkworm growth. Mr. A recognizes that each representation is at a different  
523 developmental level and uses that understanding to highlight different concepts with  
524 different students (grouping versus consistent grouping, for example). As students  
525 **examine the graphs [SEP-5]** with better understanding of what they represent, they  
526 notice a **pattern [CCC-1]** that there are more 'medium sized' silkworms and fewer short  
527 or long ones (level 5 on table 9.4), which allows Mr. A to introduce the concept of  
528 variability. Students begin to ask questions about why some silkworms are growing so  
529 much faster than others. Mr. A's targeted guidance about how to represent data helped  
530 elevate the scientific discussion.

531 Figure: Facsimiles of Student-Created Representations of Silkworm Length Data

532

533 [Link to long description](#)

534 Source: Adapted from Lehrer, 2011.

535 *Commentary:*

536 *Science and Engineering Practices (SEPs).* The emphasis of the rubric is on the ability  
 537 to count and recognize similar values, examples of using **mathematical thinking [SEP-**  
 538 **5]** at the primary level.

539 *Disciplinary Core Ideas (DCIs).* While the activity supports the DCIs that plants and  
 540 animals have unique and diverse lifecycles (LS1.B) and that individuals can vary in  
 541 traits (LS3.B), the task does not assess student understanding of these DCIs.

542 *Crosscutting Concepts (CCCs).* Students cannot complete this task without attention to  
 543 **scale and quantity [CCC-3]**, including the use of standard units to measure length.  
 544 The rubric in table 9.4 emphasizes student ability to recognize **patterns [CCC-1]** as  
 545 they create their data representations.

546 *Resource:*

547 Based on NRC, 2014

548 Source: CDE, 2018, Chapter 9.

549 Some teachers choose to give rubrics to students based around one mathematical area  
550 or standard, these are sometimes referred to as “single-point rubrics”:

Ways I could improve	Criteria	I have shown this in:
[blank]	I approach problems in different ways - using drawings, words, and color coding to connect ideas.	[blank]
[blank]	[blank]	[blank]
[blank]	[blank]	[blank]

551 Source: Gonzalez, 2015.

552 Single-point rubrics provide a way for teachers to focus on something important and to  
553 give diagnostic comments and diagnostic teacher feedback (see next section) on a  
554 particularly important area of work.

555 Examples of single-point rubrics that promote reflection and measure creativity (grade  
556 6) and communication (grade 7), from Audrey Mendivil, are given below:

557 **Creativity Rubric Part One – Creative Thought**

Something to work on	Criteria	Area of strength
[blank]	I created ideas and shared them	[blank]
[blank]	I developed new ideas using both previous and new knowledge	[blank]
[blank]	I reflected on my ideas and incorporated changes to improve my work	[blank]

558 **Creativity Rubric Part Two – Work Creatively with Others**

Something to work on	Criteria	Area of strength
[blank]	I developed, implemented and communicated new ideas to others effectively	[blank]
[blank]	I listened to diverse views and incorporated these ideas in my work	[blank]
[blank]	I demonstrated creativity and was realistic about the limits of the situation	[blank]
[blank]	I attempted or experimented as part of the path to success, including times when I failed or made a mistake	[blank]

559 **Creativity Rubric Part Three – Implement Innovation**

Something to work on	Criteria	Area of strength
[blank]	I applied creative ideas to make a real and useful contribution to the work	[blank]

560 **Reflection Rubric**

Feedback for improvement	Criteria Standards for this task	Evidence of meeting or exceeding standard
[blank]	<b>Criteria #1</b> My description includes my process for identifying and generating equivalent expressions, and has accurately represented what <b>equivalent</b> means	[blank]

<b>Feedback</b> for improvement	<b>Criteria</b> Standards for this task	<b>Evidence</b> of meeting or exceeding standard
[blank]	<b>Criteria #2</b> My description references the connection between algebraic expressions and generalizing the pattern's growth, including that the expressions should match the way I see the pattern growing.	[blank]
[blank]	<b>Criteria #3</b> My description cites specific examples of creating my own expression and my understanding of patterns' growth in relation to creating an expression AND of providing specific critique/feedback to another student (ex: TAG protocol)	[blank]
[blank]	<b>Criteria #4</b> My description includes ways I have become more precise with language, including at least one specific example of how I improved my use of language that then helped me to better communicate my ideas.	[blank]

561 **Re-engagement Lessons**

562 When students do not reveal understanding in their classroom assessments, an ideal  
563 approach to help those students and the rest of the class is to re-engage them in the  
564 ideas. This supports students who did not understand and helps those who did by  
565 offering opportunities for deepened understanding. The Silicon Valley Mathematics  
566 Initiative has offered a process and a set of resources, that have been used with

567 considerable success for many years (for example MAC and CAASP, 2015). The  
568 process starts with a performance task. Teachers then analyze student work before  
569 moving to a re-engagement lesson based on student thinking and levels of  
570 understanding. Based upon their analysis, teachers can focus on specific learning goals  
571 to meet their students where they are. By using the students' own work and reasoning  
572 teachers can design prompts for students to critique each other mathematical thinking,  
573 promote cognitive dilemmas, and address misconceptions or errors. The re-  
574 engagement lessons are taught to the entire class to deepen mathematical conceptions,  
575 promote emerging understandings, and address unfinished learning.

576 If students appear to have understood content before it is taught or at an early stage,  
577 they will be helped by providing additional opportunities for productive struggle and  
578 deeper, more innovative problem solving through investigative tasks. All students in a  
579 class can be given opportunities for appropriate struggle and challenge if open-ended  
580 investigative tasks are used.

## 581 **Teacher Diagnostic Comments**

582 Assessment for learning communicates to students where they are in their  
583 mathematical pathway and, often, how they may move forward. One way to  
584 communicate feedback is by sharing grades students have earned, but grades do not  
585 give feedback to students about ways to improve. Teacher diagnostic comments are  
586 specific comments designed to elicit cognitive skill and strategy development about a  
587 topic and are an important part of this communication and allow teachers to share with  
588 students their knowledge of ways to improve or build upon their thinking. Diagnostic  
589 comments differ from general feedback in that they direct students to reflect on the  
590 choices students made while solving a problem in order to elevate their understanding.  
591 Different researchers have compared the impact of grades with diagnostic feedback.

592 Elawar and Corno, for example, contrasted the ways students responded to  
593 mathematics homework in sixth grade, with half of the students receiving grades and  
594 the other half receiving diagnostic comments without a grade (Elawar and Corno, 1985).  
595 The students receiving comments learned twice as fast as the control group, the

596 achievement gap between male and female students disappeared, and student  
597 attitudes improved.

598 Ruth Butler also contrasted students who were given grades for classwork with those  
599 who were given diagnostic feedback and no grades (Butler, 1987, 1988). Similar to  
600 Corno and Elawar, the students who received diagnostic comments achieved at  
601 significantly higher levels. In Butler's study a third condition was added when students  
602 received grades *and* comments—combining both forms of feedback. However, this  
603 showed that the students who received grades only and those who received grades and  
604 comments scored at similar levels, and the group that achieved at significantly higher  
605 levels was the comment-only group. When students received a grade and a comment,  
606 they appeared only to focus on the grade. Butler found that both high-achieving (the top  
607 25-percent grade point average) and low-achieving (the bottom 25-percent grade-point  
608 average) fifth and sixth graders suffered deficits in performance and motivation in both  
609 graded conditions, compared with the students who received only diagnostic comments.

610 Pulfrey, Buchs, and Butera (2011) followed up on Butler's study, replicating her  
611 finding—showing again that students who received grades as well as students who  
612 received grades and comments both underperformed and developed less motivation  
613 than students who received only comments. They also found that students needed only  
614 to *think* they were working for a grade to lose motivation, resulting in lower levels of  
615 achievement.

616 Teachers may express concern about the extra time that diagnostic feedback requires,  
617 but diagnostic comments remain effective even if given occasionally, instead of frequent  
618 grading of class or homework, because they provide students with insights that can  
619 propel them onto paths of higher achievement. A teacher giving comments to students  
620 once a week is more useful than frequent grades and test scores. Many learning  
621 management systems (LMS) allow teachers to give students verbal feedback on their  
622 work. The following example of student work comes from the Interactive Mathematics  
623 Program (IMP): The High Dive Problem (Heuer, 2008).

624 The teacher comments, in green, are an example of teacher diagnostic comments—  
625 some of which are encouraging, some questioning, and some guiding (Boaler, Dance,  
626 and Woodbury, 2018).

627 Sample Diagnostic Comments for High Dive Checkpoint 1

While on a road trip with your family, you stop for lunch in a small town that has a Ferris wheel. This Ferris wheel has a radius of 30 feet, the center of the wheel is 35 feet above the ground, and the wheel completes one full rotation in 90 seconds. (The Ferris wheel still rotates counter clockwise.)

You want to impress your family by telling them how high off the ground you are at certain times. To convince your family of your expertise you justify your solutions by including labeled diagrams and organized work.

1. What is your height off the ground 18 seconds after you pass the 3:00 position.

$$360^\circ / 90 = 4^\circ / \text{sec}$$

$$4 * 18 = 72^\circ \text{ angle}$$

$$*30 \sin(72) = \frac{x}{30} * 30$$

$$30 * \sin(72) = x$$

$$28.53 = x$$

*x = Opposite*  
*Good strategy for starting the problem...*  
 $28.53 + 35 = 63.53 \text{ft}$   
 off the ground

*hmmmm... doesn't look like a right triangle in*

2. What is your height off the ground 35 seconds after you pass the 3:00 position.

$$360^\circ / 90 \text{sec} = 4^\circ / \text{sec}$$

$$4 * 35 \text{sec} = 140^\circ$$

$$*30 \sin(140) = \frac{x}{30} * 30$$

$$30 * \sin(140) = x$$

$$19.28 = x$$

*\* Trig works with angles bigger than 90° because of inversion \**  
*Confused where the angle is*  
*??? what does this mean*

$19.28 + 35 = 54.28 \text{ft.}$   
 off the ground

*I like your diagram... which side of the triangle helps you?*

*Thank you for justifying your work !!*

## 630 **Self- and Peer Assessment**

631 The two main strategies for helping students become aware of the mathematics they  
632 are learning and their broader learning pathways are self- and peer assessment. In self-  
633 assessment, students are given clear statements of the mathematical content and  
634 practices they are learning, which they use to think about what they have learned and  
635 what they still need to work on. The statements could communicate mathematics  
636 content such as, “I understand the difference between mean and median and when  
637 each should be used,” as well as mathematical practices, such as, “I have learned to  
638 persist with problems and keep going even when they are difficult.” If students start  
639 each unit of work with clear statements about the mathematics they are going to learn,  
640 they begin to focus on the bigger landscape of their learning journeys; they learn what is  
641 important, as well as what they need to work on to improve. Studies have found that  
642 when students are asked to rate their understanding of their work through self-  
643 assessment, they are incredibly accurate at assessing their own understanding, and  
644 they do not over- or underestimate it (Black et al., 2002).

645 Self-assessment can be developed at different degrees of granularity. Teachers might  
646 conduct a mathematics in a lesson or show students the mathematics across a longer  
647 period of time, such as a unit, term, or semester. In addition to understanding the  
648 criteria, students need time to reflect upon their learning. These moments can be built  
649 into plans during a lesson, at the end of the period, or even at home after considerable  
650 time to process. The following example is an algebra content self-assessment (Boaler,  
651 2016):

### 652 Algebra I Self-Assessment

#### 653 Unit 1 – Linear Equations and Inequalities

- 654 • I can solve a linear equation in one variable.
- 655 • I can solve a linear inequality in one variable.
- 656 • I can solve formulas for a specified variable.
- 657 • I can solve an absolute value equation in one variable.

658 • I can solve and graph a compound inequality in one variable.

659 • I can solve an absolute value inequality in one variable.

## 660 Unit 2 – Representing Relationships Mathematically

661 • I can use and interpret units when solving formulas.

662 • I can perform unit conversions.

663 • I can identify parts of an expression.

664 • I can write the equation or inequality in one variable that best models the  
665 problem.

666 • I can write the equation in two variables that best model the problem.

667 • I can state the appropriate values that could be substituted into an equation and  
668 defend my choice.

669 • I can interpret solutions in the context of the situation modeled and decide if they  
670 are reasonable.

671 • I can graph equations on coordinate axes with appropriate labels and scales.

672 • I can verify that any point on a graph will result in a true equation when their  
673 coordinates are substituted into the equation.

674 • I can compare properties of two functions graphically, in table form, and  
675 algebraically.

## 676 Unit 3 – Understanding Functions

677 • I can determine if a graph, table, or set of ordered pairs represents a function.

678 • I can decode function notation and explain how the output of a function is  
679 matched to its input.

680 • I can convert a list of numbers (a sequence) into a function by making the whole  
681 numbers the inputs and the elements of the sequence the outputs.

682 Peer assessment is similar to self-assessment, as it also involves giving students clear  
683 criteria for assessment, but they use it to assess each other's work rather than their  
684 own. When students assess each other's work, they gain additional opportunities to  
685 become aware of the mathematics they are learning and need to learn. Peer  
686 assessment has been shown to be highly effective, in part because students are often

687 much more open to hearing criticism or a suggestion for change from another student,  
 688 and peers usually communicate in ways that are easily understood by each other (Black  
 689 et al., 2002). This kind of collaboration allows the students to internalize the evaluative  
 690 criteria, and engage in a learning process that relies on speaking and thinking like a  
 691 mathematician.

692 One method of peer assessment is the identification of “two stars and a wish.” Students  
 693 are asked to look at their peers’ work and, with or without criteria, to select two things  
 694 done well and one area to improve on. (For lesson plans that embed formative  
 695 assessment strategies like "Two Stars and a Wish", go to [smartertoolsforteachers.org](http://smartertoolsforteachers.org).  
 696 Tools for Teachers has more than 40 formative assessment strategies as resources for  
 697 teachers.) When students are given information that communicates clearly what they  
 698 are learning, and they are asked, at frequent intervals, to reflect on their learning, they  
 699 develop responsibility for their own learning. Some people refer to this as inviting  
 700 students into the guild—giving students the powerful knowledge they perceive only  
 701 teachers to hold—which empowers them to take charge of their learning.

702 Included below is a self-assessment example that focuses on mathematical practices:

Standard for Mathematical Practice	Student-Friendly Language
1. Make sense of problems and persevere in solving them.	<ul style="list-style-type: none"> <li>• I can try many times to understand and solve a math problem.</li> </ul>
2. Reason abstractly and quantitatively.	<ul style="list-style-type: none"> <li>• I can think about the math problem in my head first.</li> </ul>
3. Construct viable arguments and critique the reasoning of others.	<ul style="list-style-type: none"> <li>• I can make a plan, called a strategy, to solve the problem and discuss other students’ strategies too.</li> </ul>
4. Model with Mathematics.	<ul style="list-style-type: none"> <li>• I can use math symbols and numbers to solve a problem.</li> </ul>
5. Use appropriate tools strategically.	<ul style="list-style-type: none"> <li>• I can use math tools, pictures, drawings, and objects to solve the problem.</li> </ul>
6. Attend to precision.	<ul style="list-style-type: none"> <li>• I can check to see if my strategy and calculations are correct.</li> </ul>
7. Look for and make use of structure.	<ul style="list-style-type: none"> <li>• I can use what I already know about math to solve the problem.</li> </ul>

Standard for Mathematical Practice	Student-Friendly Language
8. Look for and express regularity in repeated reasoning.	<ul style="list-style-type: none"> <li>I can use a strategy that I used to solve another math problem.</li> </ul>

## 704 **Mastery-based Approaches to Assessment**

705 Mastery based grading describes a form of grading that focuses on mastery of ideas,  
706 rather than points or scores. This approach is sometimes referred to as “standards-  
707 based grading” and although it refers to “standards” it does not have to focus on specific  
708 standards. It could, instead, use cluster headings, which are more akin to the Content  
709 Connections and big ideas approach of this framework – such as the Big Ideas set out  
710 in the grade span chapters and Appendix A and the assessment that goes with them,  
711 seen in the California Digital Learning Integration and Standards Guidance. The  
712 important feature of this approach is that it communicates the mathematics students are  
713 learning, and students receive feedback on the mathematics they have learned or are  
714 learning, rather than a score. This helps students view their learning as a process that  
715 they can improve on over time, rather than a score or a grade that they often perceive  
716 as a measure of their worth. A good example of a rubric that sets out the mathematics  
717 for students—not by standards but mathematical ideas—from the Robert F. Kennedy  
718 UCLA Community School, follows:

---

---

### 719 **Grade 8 Math Syllabus: Core Connections, Course 3**

720 Ms. Lee-Ortiz, Room L212, UCLA-CS

#### 721 **Introduction**

722 Each day in this class students will be using problem-solving strategies, questioning,  
723 investigating, analyzing critically, gathering and constructing evidence, and  
724 communicating rigorous arguments justifying their thinking. Under teacher guidance,  
725 students learn in collaboration with others while sharing information, expertise, and  
726 ideas. This course helps students build on the Course 2 concepts from last year in order  
727 to develop multiple strategies to solve problems and to recognize the connections  
728 between concepts.

729 Advice on Grading

730 Many teachers have to grade students, as it is a requirement of their school district or  
731 their administrators. Ideally, teachers are asked to provide grades only at the end of a  
732 course—not during the course, when students need information on ways to learn, which  
733 should be given through formative assessment. The following list compiles advice on  
734 ways to grade fairly and to continue communicating positive growth messages through  
735 assessment.

- 736 1. *Always allow students to resubmit any work or test for a higher grade*—this is the  
737 ultimate growth mindset message, communicating to students that you care about  
738 *learning*, not just performance.
- 739 2. *Share grades with school administrators but not with the students if used during a*  
740 *course*. If your school requires grades before the end of a course, this does not  
741 mean that you must give them to students. Instead, give students verbal or  
742 diagnostic written feedback on ways to improve.
- 743 3. *Use multidimensional grading*. If you believe in the breadth of mathematics and  
744 value multidimensional mathematics in the classroom, use mathematics work rather  
745 than test performance—recording, for example, whether students ask questions,  
746 reason and justify, challenge or contribute to other’s thinking.
- 747 4. *Do not use a 100-point scale*, this is mathematically egregious (see Boaler, 2016).  
748 Instead use a 4-point scale: A=4, B=3, C=2, D=1 F=0
- 749 5. *Do not include early assignments from math class in the end-of-class grade*. When  
750 teachers do this, they are essentially grading students on their work from a previous  
751 class. Grades should include only work and assignments from the point in the class  
752 when students are working on what is learned in the class.
- 753 6. *Do not include homework, if given, as any part of grading*. Homework is one of the  
754 most inequitable practices in education; its inclusion in grading adds stress to  
755 students and increases the chances of inequitable outcomes.

756 Extract from Mathematical Mindsets, Boaler, 2016

757 **Mastery Learning and Grading**

758 Grades will be determined based on demonstration of content knowledge, which are  
759 specified as Learning Targets:

Number	Learning Target
1	I know that there are numbers that are not rational, and approximate them by rational numbers.
2	I can work with radicals and integer exponents.
3	I demonstrate understanding of the connections between proportional relationships, lines, and linear equations.
4	I can analyze and solve linear equations and pairs of simultaneous linear equations.

Number	Learning Target
5	I can define, evaluate, and compare functions.
6	I can use functions to model relationships between quantities.
7	I can demonstrate understanding of congruence and similarity using physical models, transparencies, or geometry software.
8	I can understand and apply the Pythagorean Theorem.
9	I can solve real-world and mathematical problems involving volumes of cylinders, cones and spheres.
10	I can investigate patterns of association in bivariate data.

760 Grades will NOT be based on percentages or averages, but instead will be determined  
761 holistically. Grades will support the learning process and support student success. This  
762 is called Mastery Learning and Grading. Rubrics, checklists, and scoring guides will be  
763 used to provide regular feedback so that students can improve and focus on  
764 LEARNING the content. Students will have time as well as multiple opportunities to  
765 demonstrate mastery of the Learning Targets. It is not expected that you master a  
766 Learning Target the first time you learn it. The focus should be on showing growth and  
767 heading towards mastery. I will work alongside you to reach that goal. Let's maintain a  
768 growth mindset!

---

769 Mastery-based grading is a way to bring some of the very valuable aspects of formative  
770 assessment into summative assessments. This method of assessment shifts the focus  
771 from a fixed measure based on a score or a test result to a reflection of the mathematics  
772 students are working towards. Mastery-based grading breaks content into learning  
773 targets, each of which is a teachable concept for which students may demonstrate  
774 proficiency. Instead of offering partial credit for incorrect responses, students are  
775 provided feedback and opportunity to re-assess standards they do not meet in their first  
776 attempt. Teachers can then track and provide feedback based on students' work in  
777 relation to each learning target. More examples from teachers are provided below:

778 Included below is text from various standards-based report cards. To view the full  
779 images, access the source information. The criteria are designed to be evaluated  
780 intentionally at specific points in the duration of the course (i.e., trimester or quarter).

---

---

781 A kindergarten example:

782 Kindergarten Mathematics

783 Number and Operations in Base Ten

- 784 • I work with numbers 11–19 to show ten ones and some further ones.

785 Measurement and Data

- 786 • I describe, compare, and classify objects and count the number in each category.

787 Geometry

- 788 • I identify and describe flat and 3D shapes.

- 789 • I compare, create, and compose shapes.

790 Kindergarten Music

- 791 • I understand musical concepts.

- 792 • I demonstrate knowledge of musical skills.

- 793 • I participate appropriately.

794 Kindergarten Physical Education

- 795 • I demonstrate knowledge of P.E. skills

- 796 • I demonstrate sportsmanship and cooperate with classmates.

- 797 • I actively participate during physical activities.

798 Kindergarten Science

- 799 • I demonstrate an understanding of scientific content and concepts.

800 Kindergarten Social Studies

- 801 • I demonstrate an understanding of social studies content and concepts.

802 Source: ISBR, n.d.

---

---

803 Below, note further examples adapted from Saddleback Valley Unified School District:

804 Grade 6 Mathematics

805 Ratios and Proportional Relationships

- 806 • Understands ratio concepts and uses ratio reasoning to solve problems

807 The Number System

808 • Applies and extends previous understandings of multiplication and division to  
809 divide fractions by fractions

810 • Applies and extends previous understandings of numbers to the system of  
811 rational numbers

#### 812 Expressions and Equations

813 • Applies and extends previous understandings of arithmetic to algebraic  
814 expressions

815 • Understands ratio concepts and uses ratio reasoning to solve problems

#### 816 The Number System

817 • Applies and extends previous understandings of multiplication and division to  
818 divide fractions by fractions

819 • Applies and extends previous understandings of numbers to the system of  
820 rational numbers

#### 821 Expressions and Equations

822 • Applies and extends previous understandings of arithmetic to algebraic  
823 expressions

824 • Solves one-variable equations and inequalities

825 • Represents and analyzes quantitative relationships between dependent and  
826 independent variables

#### 827 Geometry

828 • Solves real-world and mathematical problems involving area, surface area, and  
829 volume

#### 830 Statistics and Probability

831 • Develops understanding of statistical variability

832 • Summarizes and describes distributions

---

833 Also adapted from Saddleback Valley Unified School District:

834 Grade 2 Mathematics

#### 835 Operations and Algebraic Thinking

836 • Represents and solves problems involving addition and subtraction

837 • Adds and subtracts fluently within 20

- 838 • Works with equal groups of objects to gain foundations for multiplication
- 839 Numbers and Operations in Base Ten
- 840 • Understands and applies place value concepts
- 841 • Uses place value understanding and properties of operations to add and subtract
- 842 Measurement and Data
- 843 • Measures and estimates lengths in standard units
- 844 • Relates addition and subtraction to length
- 845 • Works with time and money
- 846 • Represents and interprets data
- 847 Geometry
- 848 • Reasons with shapes and their attributes

---

849 Adapted from David Douglas School District, n.d.:

- 850 Grade 4 Mathematics
- 851 • Read, write, compare, and round decimals to thousandths. Convert metric
  - 852 measurements. NBT.3, NBT.1-4, MD.1
  - 853 • Fluently multiply multi-digit whole numbers using the standard algorithm. Convert
  - 854 customary measurements. NBT.5, MD.1
  - 855 • Solve multi-digit (up to 4 digit by 2 digit) whole number division problems using
  - 856 various strategies. NBT.6
  - 857 • Add, subtract, multiply, and divide decimals to the hundredths place using
  - 858 various strategies. NBT.7
  - 859 • Solve real-world and mathematical problems involving addition and subtraction of
  - 860 fractions including unlike denominators. Make line plots with fractional units.
  - 861 NF.2, NF.1, MD.2
  - 862 • Solve real-world and mathematical problems involving multiplication of fractions
  - 863 and mixed numbers, including area of rectangles. NF.6, NF.4, NF.5
  - 864 • Solve real-world and mathematical problems involving division of fractions by
  - 865 whole numbers ( $1/4 \div 7$ ) and division of whole numbers by fractions ( $3 \div 1/2$ ).
  - 866 Interpret a fraction as division. NF.7, NF.3

- 867 • Solve real-world and mathematical problems involving volume by using addition
- 868 and multiplication strategies and applying the formulas. MD.5, MD.3-5
- 869 • Solve real-world and mathematical problems by graphing points, including
- 870 numeral patterns, on the coordinate plane. G.2, G.1, OA.3

871 Adapted from Loma Prieta Joint Union School District, n.d.:

872 **Grade 4 Mathematics**

873 **Operations and Algebraic Thinking**

- 874 • Use Operations with Whole Numbers to Solve Problems
- 875 • Gain Familiarity with Factors and Multiples
- 876 • Generalize and Analyze Problems

877 **Number and Operation Base 10**

- 878 • Understand Place Value for Multi-Digit Whole Numbers
- 879 • Use Place Value Understanding and Properties of Operations to Perform Multi-
- 880 Digit Arithmetic

881 **Number Operations and Fractions**

- 882 • Understanding of Fraction Equivalence and Ordering
- 883 • Build Fractions from Unit Fractions
- 884 • Understand Decimal Notation for Fractions

885 **Measurement Data**

- 886 • Solve Problems Involving Measurement and Conversion
- 887 • Represent and Interpret Data

888 **Geometry**

- 889 • Draw, Identify, and Utilize Lines and Angles

890 **Semester 1 Learning Targets**

<b>Learning Target (LT)</b>	<b>Description*</b>
LT 1	Function Characteristics: I can identify, describe, compare, and analyze functions and/or their characteristics and use them to model situations/create functions
LT 2	Linear Functions: I can use, create, describe, and analyze linear functions using different representations.

<b>Learning Target (LT)</b>	<b>Description*</b>
LT 3	Piecewise Functions: I can use, create, describe, and analyze piecewise functions using different representations.
LT 4	Exponential Functions: I can use, create, and analyze exponential functions using different representations.
LT 5	Logarithmic Functions: I can prove laws of logarithms and use the definition and properties of logarithms to translate between logarithms in any base and simplify logarithmic expressions.
LT 6	Quadratic Functions: I can use, create, and analyze quadratic functions using different representations.
LT 7	Sequence and Series: I can analyze arithmetic, geometric, and recursive sequences and series and use different representations to solve problems.
LT 8	Eight Mathematical Practices: I can demonstrate 8 mathematical standards.
LT 9	Participation, Engagement, & Organization: I can participate and engage in class/group discussion and problem solving synchronously and asynchronously.
LT 10	Agency, Ownership, & Identity: I can take ownership over my own learning and develop positive identity as a thinker and a learner of mathematics through reflection, self-determination and grit.

891 \*Learning Topics 1–7 are considered Academic Learning Targets

892 Source: University High School

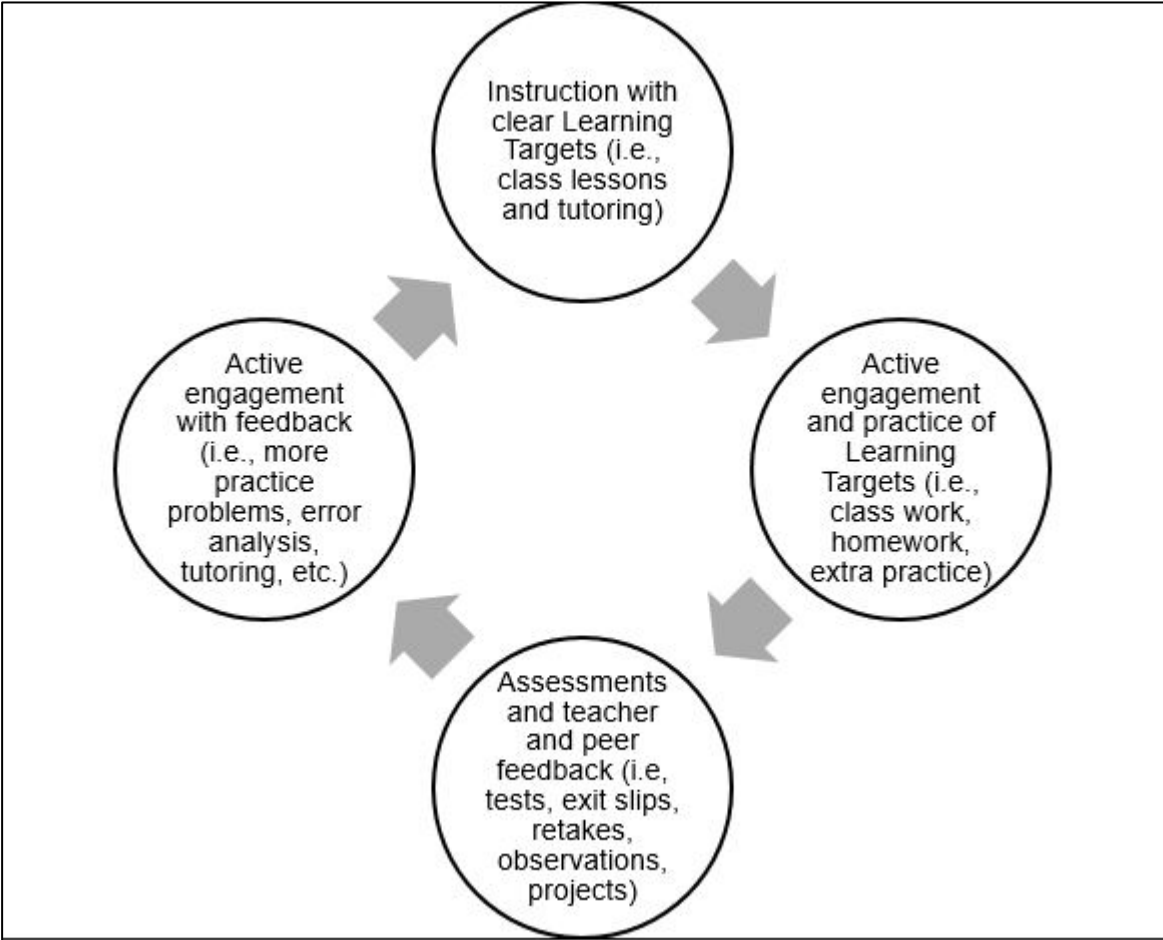

893 Mastery-based grading can be reported to districts, parents and others in the form of  
894 the clusters achieved and not associated with letter grades. Alternatively, teachers  
895 can develop structures and methods that turn mastery based-grading results into  
896 letter grades if required. These systems could be tied to the percentage of standards  
897 mastered, the number of standards at different levels, or tied to mastery of key  
898 learning outcomes and some amounts of additional material. An example, from the  
899 Robert F. Kennedy UCLA Community School, Grade Eight, is given below:

900 **Mastery Rubric**

<b>Level</b>	<b>Description</b>
4 – Mastery	You have demonstrated complete and detailed understanding of the learning target and can apply it to new problems.

Level	Description
3 – Proficiency	You have a firm grasp of the learning target and have demonstrated understanding of the concepts involved but may be inconsistent or may have minor misunderstandings and errors.
2 – Basic	You have demonstrated some conceptual understanding of the learning target but still have some confusion of key ideas or make errors more than occasionally.
1 – Beginning	You have demonstrated little or unclear understanding, or have multiple misunderstandings about the learning target.
0 – Not yet	You have not attempted this learning target yet, or have not turned in work for this learning target to be assessed.

901 Cycle for Mastery Learning

902

903 [Link to long description](#)

904 Students learn at different rates and in different ways, so grades will be based on  
 905 learning over time after many opportunities for practice with feedback. Final grades will  
 906 be determined on the achievement, consistency, and improvement of mastering the  
 907 Learning Targets evidenced by assessments and work submitted, such as tests, exit  
 908 slips, teacher observations, and projects.

909 **Final Academic Grade**

Grade	Description
A	Demonstrate mostly Mastery (4) level in Learning Targets, and nothing less than a 3 in the other Learning Targets
B	Demonstrate at least Proficiency (3) level in most Learning Targets, and nothing less than a 2 in the other Learning Targets
C	Demonstrate at least Basic Understanding (2) level in all the Learning Targets
D	Demonstrate at least Beginning (1) level in all Learning Targets
F	Demonstrate that few or none of the Learning Targets are achieved with at least a Beginning (1) level

910 One key benefit of using mastery-based grading is that it includes a lot more  
 911 information on what students actually know. When it includes opportunities for  
 912 reassessment, and students working with feedback to improve their results, it also  
 913 encourages important growth mindset messages. Researchers have considered  
 914 parents' responses to a shift to mastery-based grading, finding that parents are  
 915 supportive of mastery-based grading, as an alternative to traditional grading  
 916 (Brookhart et al., 2016). Mastery-based report cards may contain the language of  
 917 cluster headings or standards and may need explanations for parents to understand  
 918 their child's strengths and challenges. Building knowledge or simplifying the meaning  
 919 of the language could accompany feedback that is given to parents. Research studies  
 920 have shown that mastery-based grading improves student engagement and  
 921 achievement (Iamarino, 2014; Townsley et al., 2016; Selbach-Allen et al., 2020).

922 On a final note, since mastery-based grading is based on students' meeting of learning  
923 targets, grade reports function differently. Test and quiz scores, for example, as  
924 percentages are often averaged and translated to letter grades in a traditional system  
925 whereas, in a mastery-based system, mastery of topics is evidenced and communicated  
926 over time and in multiple ways. At early points in the year, it should not be expected that  
927 students would have mastered all, or even a significant number, of learning targets and  
928 grade reports would reflect this progression. Schools should provide clear and  
929 consistent messaging regarding mastery-based grading systems to help parents and  
930 students understand report cards.

931 In traditional grading systems, points are often offered for participation, attendance,  
932 behavior and homework completion. These measures often bring inequity into the  
933 grading system as students outside circumstances will impact these aspects of their  
934 grade. The final grade becomes more about behaviors than learning. While mastery  
935 grading is not a panacea to fix inequities in assessments, it ensures grades and  
936 assessment relate to demonstrated knowledge rather than behaviors that may not  
937 reflect student's actual learning.

## 938 **Effective Assessment Strategies for English Learners**

939 Recognizing the interdependency of disciplinary language and content, teachers are  
940 recommended to formatively assess students' use of language in the context of  
941 mathematical reasoning over time. At the outset of a unit, students would likely use  
942 more exploratory language including everyday language, and over the course of the  
943 units, students would add to their repertoire the more standard, less ambiguous, form of  
944 mathematical conventions and agreements. One of several Mathematical Language  
945 Routines that has been developed is called "Collect and Display" (Zwiers et al., 2017,  
946 11) where the teachers listen to students' use of language, then they display the  
947 collection of terms they heard and this becomes a language resource for the class.  
948 Such a record is useful as it shows the development of language over the time.

949 Teachers should also provide rubrics, including a discussion of key academic  
950 vocabulary, so that the criteria for success is clear to students. Because rubrics can be

951 used to conduct self- and peer assessments (in addition to assessment by the teacher),  
952 it can be useful for teachers to provide language instruction, including frames for  
953 collaborative criteria chats, if key terms are expected in students' explanations.

954 For culminating assessments, teachers should do an analysis of the language demands  
955 prior to administering the assessments, and backward planning, guided by the following  
956 questions:

- 957 • What opportunities are provided for students to explain and elaborate their  
958 reasoning?
- 959 • Prior to the assessment, have students have had sufficient opportunities to  
960 practice using the kind of language that is expected to demonstrate their  
961 mathematical reasoning?
- 962 • Have students received feedback and a chance to apply that feedback to their  
963 work?

---

---

964 **EXAMPLE:** In a unit test, suppose students are asked to explain how they know that a  
965 linear system of equations has no solutions. Throughout the instructional unit, students  
966 should have opportunities to generate and refine such explanations, working on specific  
967 cases but also building up to the language of generalization over time. Students should  
968 examine examples of explanations that include visuals of parallel lines, along with a  
969 focus on the slopes of the given lines in this case. Using language for complex ideas is  
970 an attainable goal for English learners, but only if there is thoughtful planning and  
971 support throughout the instruction.

---

---

972 Feedback on student explanations on assessments should follow the same principles of  
973 high-quality feedback for English learners: feedback should acknowledge what was  
974 done correctly, ask clarifying questions, and give students an opportunity to revise their  
975 work.

976 As teachers continue to collect formative data about students' language, they can act on  
977 that data by assessing growth over time, adjust instruction, and consider possible  
978 flexible groupings to provide more targeted support.

979 Teachers may consider the following assessment modifications appropriate for  
980 linguistically and culturally diverse English learners in the process of acquiring English:

- 981 ● Allow verbal answers rather than requiring writing, or provide some combination
- 982 ● Consider chunking longer assessments into smaller parts
- 983 ● Enlist a qualified bilingual professional to help provide multiple means of  
984 assessments and support formative and summative assessment
- 985 ● Consider group assessments as a means for English learners to demonstrate  
986 progress
- 987 ● Allow students to give responses in multiple formats and with the support of  
988 manipulatives.
- 989 ● Accept responses in the students’ native language if translation support systems  
990 exist in the school
- 991 ● Allow culturally and linguistically diverse English learners to use bilingual  
992 dictionaries or translation software to support their language learning.

### 993 **Summative Assessment**

994 Summative assessment is assessment of learning. Summative assessments typically  
995 occur at the end of a learning cycle in order to ascertain students’ acquisition of  
996 knowledge and skills in the subject. On a classroom level, exams, quizzes, worksheets,  
997 and homework have traditionally been used as summative measures of learning for  
998 particular units or chapters. Summative assessments have the potential to be anxiety-  
999 inducing for students, so some best practices should be implemented to minimize  
1000 damaging effects. The Poorvu Center at Yale has compiled the following list:

<b>Practice</b>	<b>Explanation</b>
<b>Use a Rubric or Table of Specifications</b>	Instructors can use a rubric to lay out expected performance criteria for a range of grades. Rubrics will describe what an ideal assignment looks like, and “summarize” expected performance at the beginning of term, providing students with a trajectory and sense of completion.

Practice	Explanation
<b>Design Clear, Effective Questions</b>	If designing essay questions, instructors can ensure that questions meet criteria while allowing students freedom to express their knowledge creatively and in ways that honor how they digested, constructed, or mastered meaning.
<b>Assess Comprehensiveness</b>	Effective summative assessments provide an opportunity for students to consider the totality of a course’s content, making broad connections, demonstrating synthesized skills, and exploring deeper concepts that drive or found a course’s ideas and content.
<b>Make Parameters Clear</b>	When approaching a final assessment, instructors can ensure that parameters are well defined (length of assessment, depth of response, time and date, grading standards); knowledge assessed relates clearly to content covered in course; and students with disabilities are provided required space and support.
<b>Consider Blind Grading</b>	Instructors may wish to know whose work they grade, in order to provide feedback that speaks to a student’s term-long trajectory. If instructors wish to provide truly unbiased summative assessment, they can also consider blind grading. This process is explained, with examples, by the Yale Poorvu Center for Teaching and Learning.

1001 One of the problems with a classroom approach based upon frequent grading is that  
1002 teachers are using summative measures hoping they will have a formative effect and  
1003 impact learning. One alternative to this approach is standards-based grading, which can  
1004 be used in ways that support formative and summative assessment.

1005 Examples of summative questions, from primary, upper elementary, middle school and  
1006 high school, are given below.

1007 Summative assessment questions:

1008 Primary:

- 1009 • You have a collection of objects and your friend gives you six more. How many  
1010 do you have and how do you know? Explain your reasoning using words,  
1011 pictures and numbers.

1012

1013 Upper elementary:

- 1014
- You have a 48-foot-long fence made up of four-foot panels. How many four-foot panels are there? How do you know? Write a number sentence showing the calculation needed for this question. Fully explain how your number sentence models this situation.
- 1015
- 1016
- 1017

1018

1019 Middle School:

- 1020
- A point is located at -17 on a number line. If you add 8 to -17 and move the point, where will it be located? Draw the number line showing the movement and write a number sentence that represents the movement of the point. What whole number is between? Make a convincing argument proving how you know.
- 1021
- 1022
- 1023
- 1024 Explain your reasoning fully.

1025 High School:

- 1026
- $F(x) = 3x+2$  where the domain is over the interval  $[0,7]$ . Graph the function and include a table of values showing the integer ordered pairs. Write a story that might be modeled by this function. Explain how your story models the function.
- 1027
- 1028

## 1029 Retaking Assignments and Tests

1030 Assignments and tests that occur frequently can still provide a valuable learning  
1031 experience for students when they are not seen as the end to a learning cycle. Some  
1032 teachers believe that others retaking work is not fair practice, believing students may go

1033 away and learn on their own what they need to improve their grade but such efforts are,  
1034 at their core, about learning, and should be valued. Some teachers believe that if  
1035 learners can retake and get full marks on their second attempt, it encourages students  
1036 to take initial assessments less seriously, but this is not how students approach such  
1037 opportunities. Allowing students to retake work sends an important growth mindset  
1038 message and encourages further learning. Just as career mathematicians are  
1039 constantly revising their work and conjectures, students should be allowed the same  
1040 fluidity in their own learning process. See the snapshot below for an example of how  
1041 retaking a test can enable further learning.

1042 Allowing students to resubmit any work or test is the ultimate growth mindset message,  
1043 focusing assessment upon learning, rather than performance.

---

---

1044 ***Snapshot***

1045 Kaj has noticed that, for some of her students, the unit tests are anxiety-inducing—both  
1046 in the taking of the tests and in receiving potentially low scores a few days later. In  
1047 talking with an English language arts/literacy (ELA) peer teacher, the subject of testing  
1048 came up, and her peer pointed out that drafts and revisions are the norm in ELA. Kaj  
1049 wondered if embedding a revision cycle into the testing could help her students with test  
1050 anxiety and with long-term retention.

1051 For her next unit test, she announces to the class that they will have the opportunity to  
1052 revise their work on any items that they lost significant points. In the week before the  
1053 test, she overheard some of her students mentioning that they might just “wing it” since  
1054 they can just retake items later. She decided that a few rules were needed: when taking  
1055 the test, an attempt must be made and answer found on all problems; a revision  
1056 included three components: a correct solution with all steps shown, an annotated  
1057 version of the original work with explanation of what was overlooked or missed, and a  
1058 citation of the resource used—such as page number or class notes.

1059 On testing day, she noticed that for those students that typically struggled, they seemed  
1060 to be writing more and leaving fewer questions unanswered. During grading she was

1061 careful to give written feedback (see earlier Diagnostic Comments section) that was  
1062 both positive and constructive so students were more inclined to revise their work rather  
1063 than scrapping it entirely, if possible. As the revisions came in, Kaj was heartened to  
1064 see that her students improved upon their work considerably, and their scores reflected  
1065 this improvement. She also noticed that, for many of her students, the revision process  
1066 enabled better retention in the long term. As Kaj made further changes to the system,  
1067 as well as instituting a peer checking system, she was able to address the extra grading  
1068 time for herself as well as some of the complaints about fairness she overheard from a  
1069 few parents. For the next year, she planned on including good study practices in the  
1070 lead-up to a test, and having her students talk with a classmate to help identify which  
1071 topics were most difficult for them. Overall, she felt that developing these types of  
1072 reflection, self-awareness and anticipation skills in her students will bode well for them  
1073 with future learning experiences.

---

---

## 1074 **Portfolios**

1075 Perhaps the most comprehensive way to assess student learning is through a  
1076 portfolio—a collection of work that communicates students' activities over a length of  
1077 time. It could include project work, photographs, audio samples, letters, digital artifacts  
1078 and other records of mathematical work. Portfolios allow students to choose and  
1079 assemble their best work, selecting the contents and reflecting on the reasons for their  
1080 inclusion. Portfolios are particularly appropriate ways of assessing data science  
1081 projects. Students should have the option of demonstrating their math knowledge of  
1082 math concepts through the use of their home language.

1083 Portfolios can be scored using well-developed rubrics or criteria. They can have good  
1084 value when used as a way of communicating student progress to parents. Ideally, they  
1085 tell a story of student growth in learning the content and practices of mathematics. The  
1086 detail can help parents support their students' learning and expand collaboration  
1087 between schools and families. In distance learning settings portfolios can provide a  
1088 powerful means for students to demonstrate understanding and knowledge, and can be  
1089 easily compiled with the use of technology.

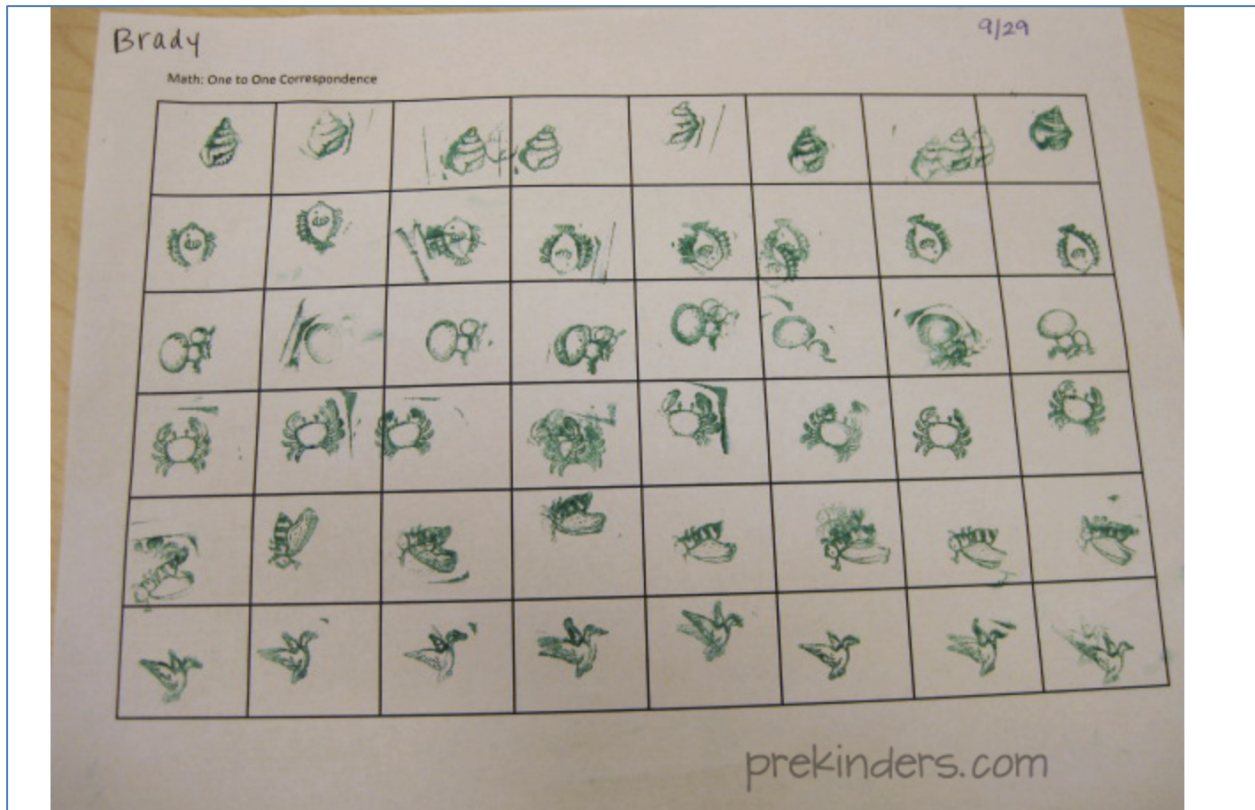

1090 Examples of Pre-K Mathematics Portfolios (Prekinders, n.d.) and the following are  
1091 examples of tasks a kindergarten teacher included in her student portfolio:

1092

1093

One to one correspondence: stamp bingo dot markers in squares

1094

1095

One to one correspondence with rubber stamps

Rebecca

SEP 23

2 houses

1096

1097

Represent numbers with drawing

1098

1099

Sorting paper cutouts by color

## 1100 **Smarter Balanced Assessment System and the CAASPP**

1101 California’s statewide assessment program, known as the California Assessment of  
1102 Student Performance and Progress (CAASPP), is comprised of various assessments  
1103 including the Smarter Balanced system of assessments for mathematics and English  
1104 language arts/literacy. The summative assessment for mathematics is designed to  
1105 measure students’ and schools’ progress toward meeting the goals of the California  
1106 Common Core State Standards for Mathematics (CA CCSSM) for grades three through  
1107 eight and in grade eleven.

1108 The Smarter Balanced assessments which are untimed and include items and tasks in  
1109 many formats, require students to think critically, solve problems, and show a greater  
1110 depth of knowledge. The Smarter Balanced assessment provides a full range of  
1111 assessment resources for all students, including those who are English learners and  
1112 students with disabilities. These resources ensure that the assessment meets the needs  
1113 of all students. The Smarter Balanced summative assessment in mathematics is  
1114 available in Spanish using a Language Toggle tool that allows students to toggle the  
1115 preferred language of the testing interface between English and Spanish. The CAASPP  
1116 summative assessments are available in Spanish in a “stacked version” showing the  
1117 questions/problems in English and Spanish. Districts and schools can designate which  
1118 students should be given this form of the assessment and do the appropriate  
1119 documentation required.

1120 In measuring students’ and schools’ progress toward meeting the CA CCSSM, there are  
1121 three key aspects of the CAASPP: computer-based, computer-adaptive and varied item  
1122 types.

- 1123 • *Computer-based testing.* All schools with eligible students in grades three  
1124 through eight and eleven are required to administer electronically. Computer-  
1125 based testing allows for smoother test administration, faster reporting of results,  
1126 and the utilization of computer-adaptive testing.
- 1127 • *Computer-adaptive testing.* The Smarter Balanced assessments use a system  
1128 that monitors a student’s progress as he or she is taking the assessment and  
1129 presents the student with harder or easier problems depending on the student’s

1130 performance on the current item. In this way, the computer system can adjust to  
1131 more accurately assess the student's knowledge and skills.

1132 • *Varied item types.* The Smarter Balanced tests allow for a variety of types of  
1133 items that are each intended to measure different learning outcomes. For  
1134 instance, a selected response item may have two correct choices out of four; a  
1135 student who selects only one of those correct items would indicate a different  
1136 understanding of a concept than a student who selects both of the correct  
1137 responses. Constructed-response questions are featured, as well as  
1138 performance tasks (which include extended-response questions) that measure  
1139 students' abilities to solve problems and use mathematics in context, thereby  
1140 measuring students' progress toward employing the mathematical practice  
1141 standards and demonstrating their knowledge of mathematics content. Finally,  
1142 the assessments feature technology-enhanced items that aim to provide  
1143 evidence of mathematical practices. These items utilize the technology of the  
1144 online test format to provide an item type not possible in paper pencil  
1145 assessment. They are aligned with the following four claims:

Claim	Explanation
Claim 1	<p data-bbox="354 1142 1401 1251">Concepts and Procedures: Students can explain and apply mathematical concepts and interpret and carry out mathematical procedures with precision and fluency.</p> <p data-bbox="354 1289 1425 1575">This claim addresses procedural skills and the conceptual understanding on which the development of skills depends. It uses the cluster headings in the CA CCSSM as the targets of assessment for generating evidence for the claim. It is important to assess students' knowledge of how concepts are linked and why mathematical procedures work the way they do. Central to understanding this claim is making the connection to elements of these mathematical practices as stated in the CA CCSSM: SMP.5, SMP.6, SMP.7, and SMP.8.</p>

Claim	Explanation
Claim 2	<p>Problem Solving: Students can solve a range of complex, well-posed problems in pure and applied mathematics, making productive use of knowledge and problem-solving strategies.</p> <p>Assessment items and tasks focused on Claim 2 include problems in pure mathematics and problems set in context. Problems are presented as items and tasks that are well posed (that is, problem formulation is not necessary) and for which a solution path is not immediately obvious. These problems require students to construct their own solution pathway rather than follow a solution pathway that has been provided for them. Such problems are therefore unstructured, and students will need to select appropriate conceptual and physical tools to solve them.</p>
Claim 3	<p>Communicating Reasoning: Students can clearly and precisely construct viable arguments to support their own reasoning and to critique the reasoning of others.</p> <p>Claim 3 refers to a recurring theme in the CA CCSSM content and practice standards: the ability to construct and present a clear, logical, and convincing argument. For older students this may take the form of a rigorous deductive proof based on clearly stated axioms. For younger students this will involve justifications that are less formal. Assessment tasks that address this claim typically present a claim and ask students to provide a justification or counterexample.</p>
Claim 4	<p>Modeling and Data Analysis: Students can analyze complex, real-world scenarios and can construct and use mathematical models to interpret and solve problems.</p> <p>Modeling is the bridge between “school math” and “the real world”—a bridge that has been missing from many mathematics curricula and assessments. Modeling is the twin of mathematical literacy, which is the focus of international comparison tests in mathematics given by the Programme for International Student Assessment (PISA). The CA CCSSM feature modeling as both a mathematical practice at all grade levels and a content focus in higher mathematics courses.</p>

1146 **Interim Assessment**

1147 Interim assessments allow teachers to check students’ progress at mastering specific  
 1148 concepts at strategic points throughout the year. Teachers can use this information to  
 1149 support their instruction and help students meet the challenge of college- and career-

1150 ready standards. There are a variety of interim assessments used by teachers, such as  
1151 cumulative mid-quarter or quarter assessments, and opportunities for students to  
1152 demonstrate understanding about topics from prior weeks or months. Collectively,  
1153 Smarter Balanced Interim Assessments provide teachers with an array of useful  
1154 formative assessment options tailored to the CA CCSSM students are learning.  
1155 Smarter Balanced offers the following interim assessments:

- 1156 • Interim Comprehensive Assessments (ICAs) that test the same content and  
1157 report scores on the same scale as the summative assessments.
- 1158 • Interim Assessment Blocks (IABs) that focus on smaller sets of related concepts  
1159 and provide more detailed information for instructional purposes.
- 1160 • Focused IABs that assess no more than three assessment targets to provide  
1161 educators with a finer grained understanding of student learning.

1162 The Smarter Balanced Interim Assessments can be used by teachers at any time  
1163 before, during, and after instruction in a standardized administration or a non-  
1164 standardized manner. Examples of interim assessment flexibility:

- 1165 1. Teachers can administer the interim assessments as an end-of-unit summative  
1166 "traditional" assessment of learning.
- 1167 2. Teachers can display and discuss interim assessment items with students as a  
1168 formative assessment during instruction to clarify learning.
- 1169 3. Teachers can analyze individual and group responses in the reporting system  
1170 and plan instructional next steps accordingly.

## 1171 **Conclusion**

1172 Assessment in mathematics is in a period of transition, from tests of fact-based skills to  
1173 multi-faceted measures of sense-making, reasoning, and problem-solving. In this way,  
1174 there is a growing alignment between how mathematics is being taught, and how it is  
1175 being tested. A comprehensive system of assessment should provide all educational  
1176 partners with the levels of detail to make informed decisions. Educators, administrators,  
1177 and policymakers should focus on assessment that engages students in continuous  
1178 improvement efforts by using “mastery-based approaches”—assessing with rubrics,  
1179 self, peer and teacher feedback. Such an approach reflects the important goal of

1180 achieving conceptual understanding, problem solving capacity and procedural fluency.  
1181 Such an approach will maximize the amount of learning each child is capable of, while  
1182 minimizing the socio-cultural effects of narrow testing. At the most fundamental level,  
1183 each educational partner has an important role in supporting classroom teachers' use of  
1184 assessment in making the critical minute-by-minute decisions that afford better learning  
1185 for all students in their care. All educational partners working collaboratively within a  
1186 system of assessment should ensure that all students in California have access to the  
1187 rich mathematical ideas and practices set forth in the CA CCSSM.

## 1188 **Long Descriptions for Chapter 12**

1189 Figure 12.1. Big Idea Network Map for Grade Three

1190 The graphic illustrates the connections and relationships of some third-grade  
1191 mathematics concepts. Direct connections include:

- 1192 • Fractions of Shape & Time directly connects to: Square Tiles, Fractions as  
1193 Relationships, Unit Fractions Models, Represent Multivariable Data
- 1194 • Measuring directly connects to: Number Flexibility to 100, Analyze Quadrilaterals,  
1195 Represent Multivariable Data
- 1196 • Addition and Subtraction Patterns directly connects to: Number Flexibility to 100,  
1197 Unit Fraction Models, Analyze Quadrilaterals, Represent Multivariable Data
- 1198 • Square Tiles directly connects to: Fractions as Relationships, Number Flexibility  
1199 to 100, Fractions of Shape & Time
- 1200 • Fractions as Relationships directly connects to: Square Tiles, Fractions of Shape  
1201 & Time, Unit Fraction Models
- 1202 • Unit Fraction Models directly connects to: Fractions as Relationships, Addition  
1203 and Subtraction Patterns, Fractions of Shape & Time, Represent Multivariable  
1204 Data

- 1205 • Analyze Quadrilaterals directly connects to: Number Flexibility to 100, Addition  
1206 and Subtraction Patterns, Measuring
- 1207 • Represent Multivariable Data directly connects to: Unit Fraction Models, Number  
1208 Flexibility to 100, Addition and Subtraction Patterns, Measuring, Fractions of  
1209 Shape & Time
- 1210 • Number Flexibility to 100 directly connects to: Square Tiles, Analyze  
1211 Quadrilaterals, Represent Multivariable Data, Measuring, Addition and  
1212 Subtraction Patterns. [Return to graphic.](#)

1213 Figure 12.3

1214 This image shows the different types of assessments in relation to one another. From  
1215 left to right the “Student” right arrow points to “Short cycle assessments”: Minute-by-  
1216 minute; Daily; Weekly; Right arrow to “Medium cycle assessments”: Unit and Quarterly;  
1217 right arrow to “long-cycle assessments”: Annually; right arrow to “Standards.” [Return to  
1218 graphic.](#)

1219 Example of SMP.1

1220 Indicating four levels of student proficiency in SMP. 1: Make sense of problems and  
1221 persevere in solving them.

- 1222 • Level 1 is “I can show at least one attempt to investigate or solve the task.
- 1223 • Level 2 is “I can ask questions and clarify the problem and I can keep working  
1224 when things aren’t going well and try again.”
- 1225 • Level 3 is “I can make sense of problems and persevere in solving them”  
1226 (standard reached)
- 1227 • Level 4 is “I can find a second or third solution and describe how the pathways to  
1228 the solutions relate.”
- 1229 [Return to graphic.](#)

1230 Figure: Facsimiles of Student-Created Representations of Silkworm Length Data

1231 This figure shows three different student graphs. Graph A is a bar graph; length is on  
1232 the y-axis (no markings or units); there are numbers on the x-axis as follows: 5, 7, 8, 9,  
1233 9, 10, 10, 10, and 10. New page has 10, 10, 11, 12, 12, 12, 12, 12, 12, and 12. New  
1234 page has 13, 14, 14, 15, 15, 15, 15, 15, 15, and 17...

1235 Graph B is a bar graph. On the y-axis is the label "Count" marked from 0 to 6+ in  
1236 increments of 2. On the x-axis is "Length (mm)" and ranges from 0 to 29... in  
1237 increments of 1. There are no bars at 0 to 4; a bar with height 1 at 5; 6 is empty; 7 has  
1238 1; 8 has 2; 9 has 2; 10 has 6+; 11 has 3; 12 has 6+; 13 has 1; 14 has 3; 15 has 6+; 16  
1239 has 0; 17 has 2; 18 has 5; 19 has 3. New page: 20 has 6+; 21 has 2; 22 has 3; 24 has  
1240 0; 25 has 6+; 26 has 2; 27 has 1; 28 has 2; 29 has 2. Graph C is a kind of bar graph  
1241 with intervals. On the y-axis is the label "Count" with no markings or units. On the x-axis  
1242 in Length in mm. The first interval is 0-10 and has 4 in it. The second interval is 10-20  
1243 and has 10 in it. The third interval is 20-30 and has 10 in it. Also, because of the size  
1244 difference in the ovals and the gap in the data, this line appears much taller than the  
1245 one before it. The fourth interval is 30-40 and has 8 in it. The fifth interval is 40-50 and  
1246 has 4 in it. The sixth interval is 50-60 and has one in it. [Return to graphic.](#)

1247 Sample Diagnostic Comments for High Dive Checkpoint 1

1248 Problem one asks, "What is your height off the ground 18 seconds after you pass the  
1249 3:00 position." Teacher comments that student's note that  $x = \text{opposite}$  is a "good  
1250 strategy for solving the problem." The teacher notes the drawing of the 12-section Ferris  
1251 wheel "doesn't look like a right triangle." Problem two asks, "What is your height off the  
1252 ground 35 seconds after you pass the 3:00 position." Student notes that trigonometry  
1253 works with angles bigger than 90 degrees of inversion; teacher wonders "what does this  
1254 mean?" Teacher comments "Thank you for justifying your work!!" and "I like your  
1255 diagram.... Which side of the triangle helps you?" [Return to graphic.](#)

1256 Cycles for Mastery Learning

1257 Cycles for Mastery Learning process graphic shows how teachers move from instruction  
1258 with clear learning targets to active engagement and practice of the learning targets,  
1259 assess through teacher and peer feedback, and engage with the feedback to  
1260 understand next steps. [Return to graphic.](#)
